Lecture 3

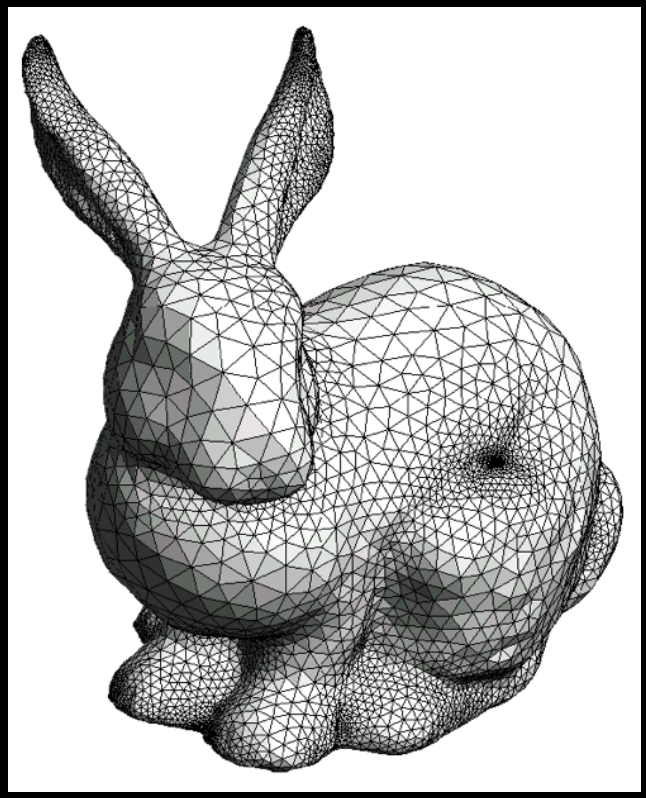
Interaction

Client/Server Model
Callbacks
Double Buffering
Hidden Surface Removal
Simple Transformations
[Angel Ch. 3]

Jernej Barbic
University of Southern California

Triangles (Clarification)

- Can be any shape or size
- Well-shaped triangles have advantages for numerical simulation
- Shape quality makes little difference for basic OpenGL rendering

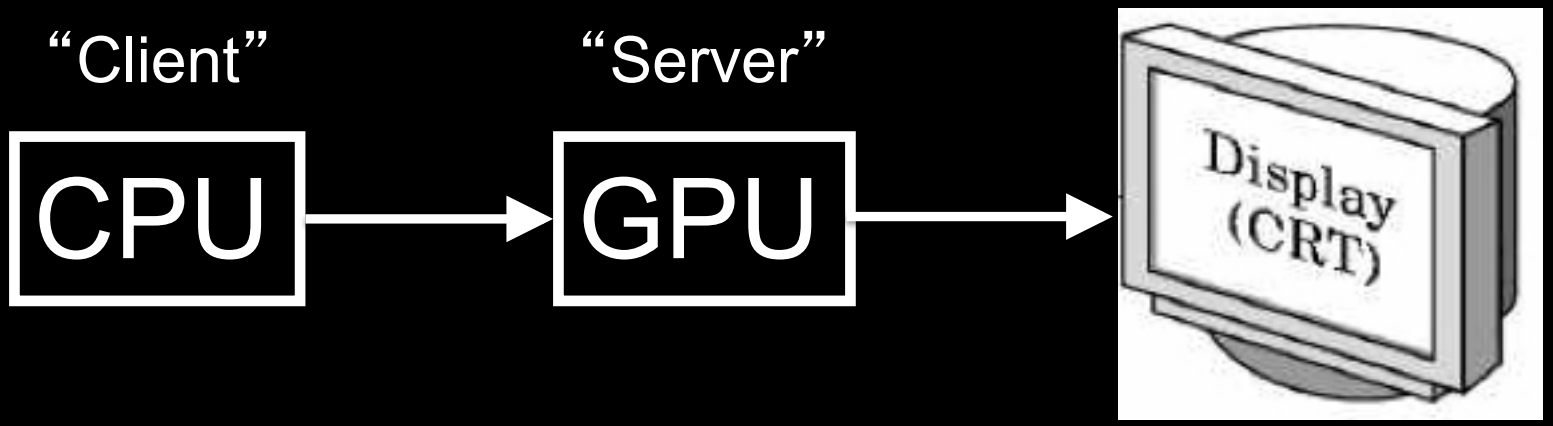


Choice of Programming Language

- OpenGL lives close to the hardware
- OpenGL is not object-oriented
- OpenGL is not a functional language (as in, ML)
- Use C to expose and exploit low-level details
- Use C++, Java, ... for toolkits
- Support for C in assignments

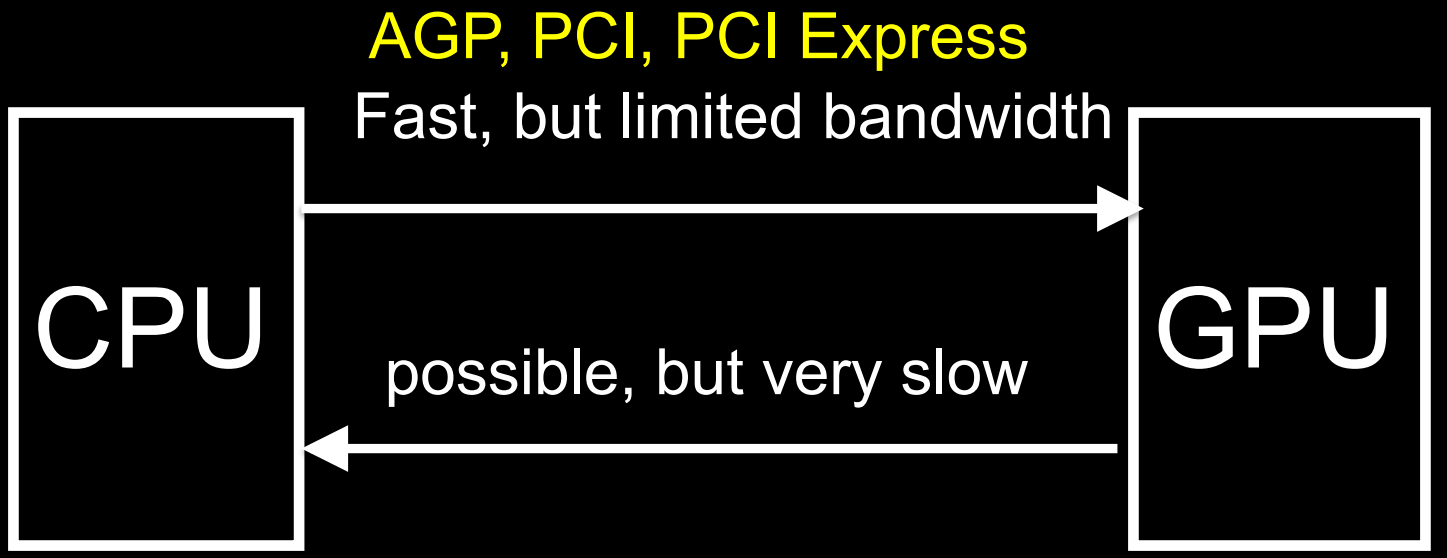
Client/Server Model

- Graphics hardware and caching



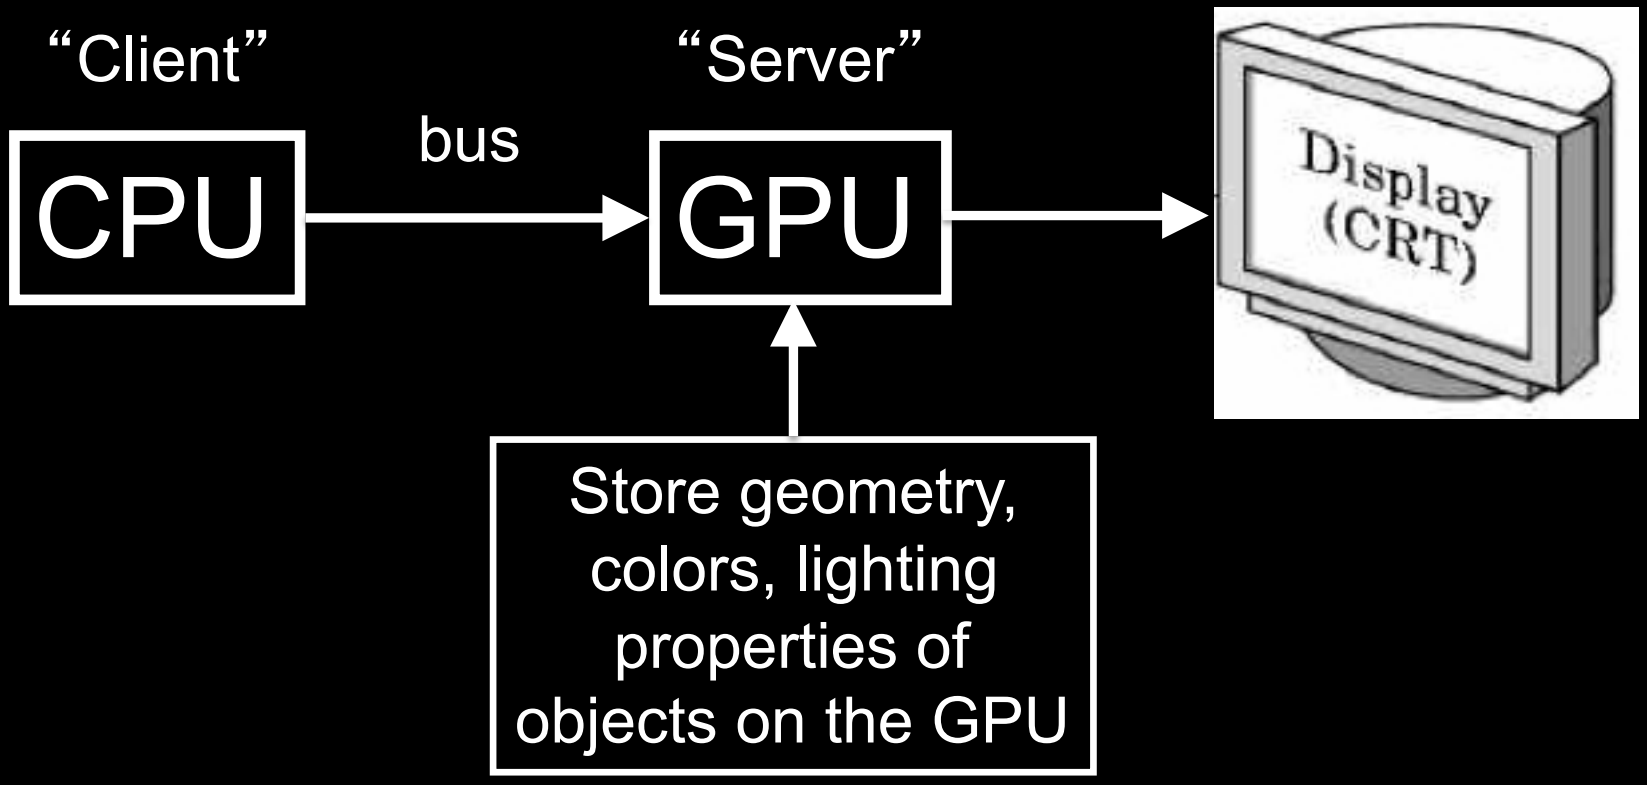
- Important for efficiency
- Need to be aware where data are stored
- Examples: vertex arrays, display lists

The CPU-GPU bus



Display Lists

- Cache a sequence of drawing commands
- Optimize and store on server (GPU)



Display Lists

- Cache a sequence of drawing commands
- Optimize and store on server (GPU)

```
GLuint listName = glGenLists(1);    /* new list name */
glNewList (listName, GL_COMPILE); /* new list */
    glColor3f(1.0, 0.0, 1.0);
    glBegin(GL_TRIANGLES);
        glVertex3f(0.0, 0.0, 0.0);
        ...
    glEnd();
glEndList(); /* at this point, OpenGL compiles the list */
glCallList(listName);     /* draw the object */
```

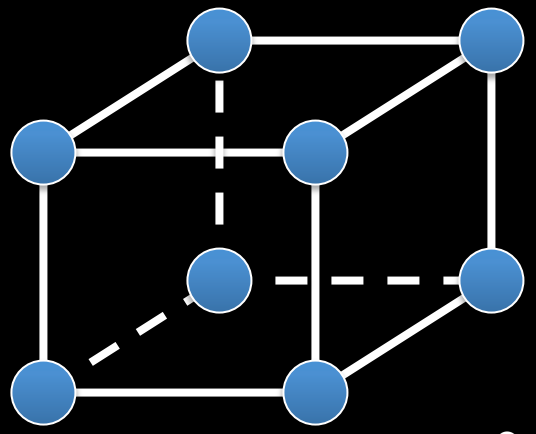
Display Lists Details

- Very useful with complex objects that are redrawn often (e.g., with transformations)
- Another example: fonts (2D or 3D)
- Display lists can call other display lists
- Display lists cannot be changed
- Display lists can be erased / replaced
- Not necessary in first assignment

- Display lists are now deprecated in OpenGL
- For complex usage, use the VertexBufferObject (VBO) extension

Vertex Arrays

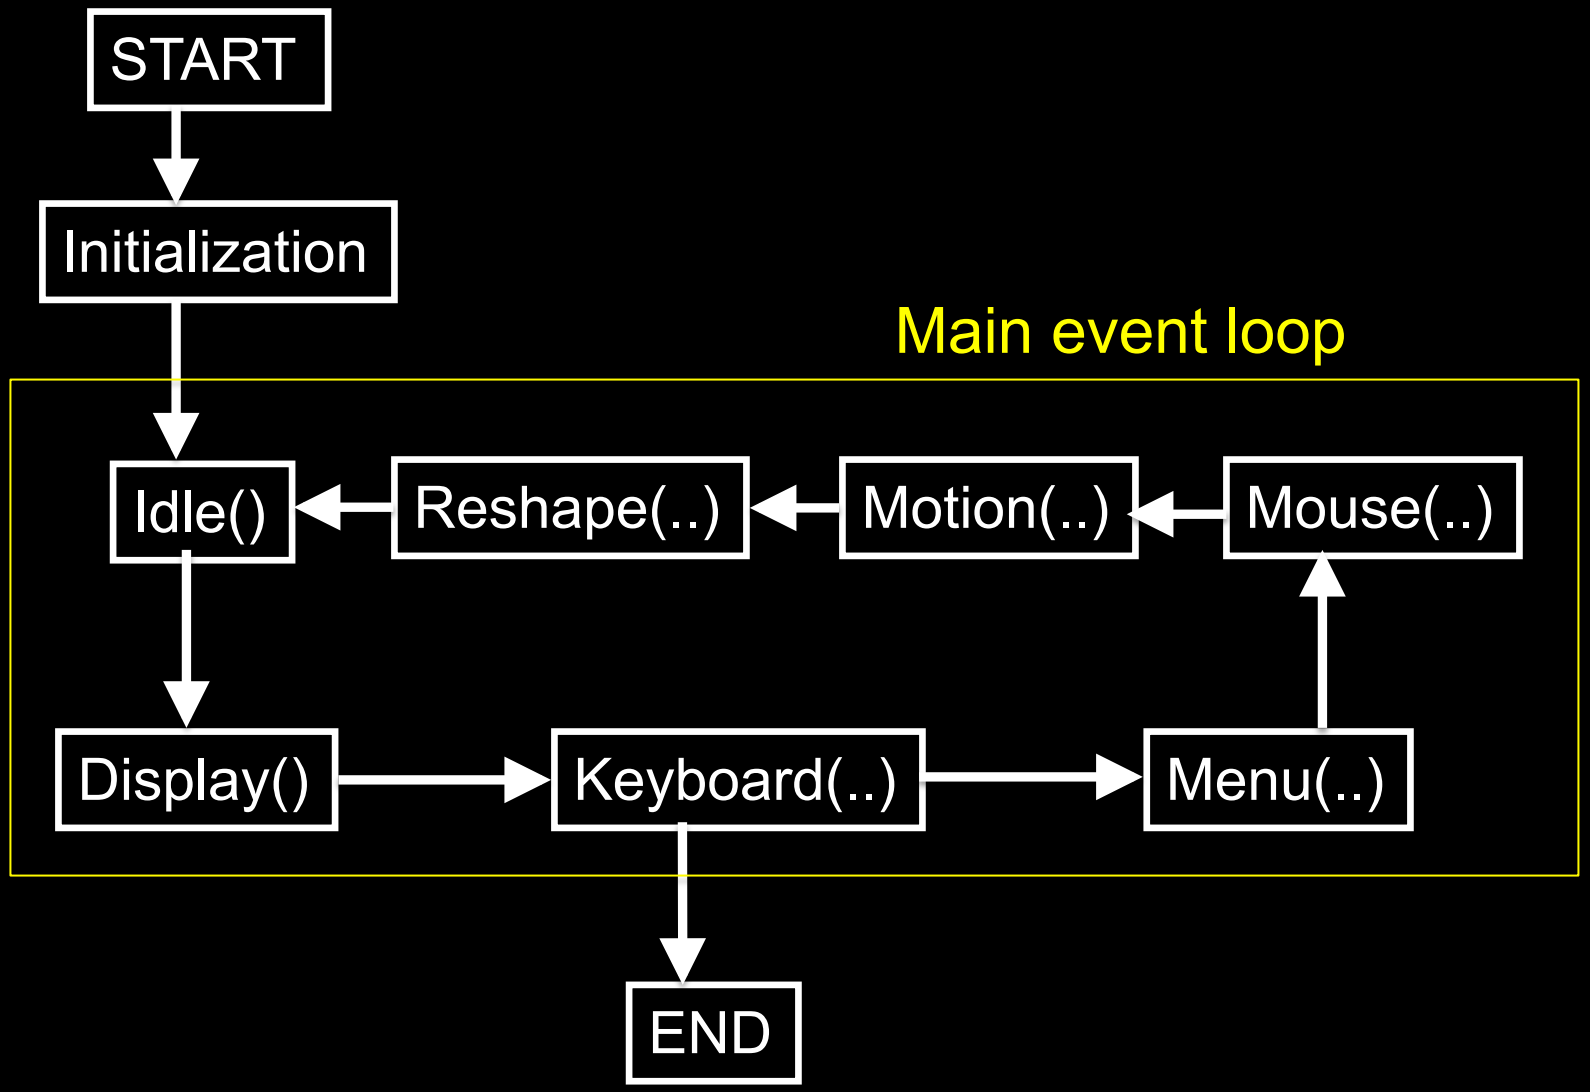
- Draw cube with 6*4=24 or with 8 vertices?
- Expense in drawing and transformation
- Strips help to some extent
- Vertex arrays provide general solution
- Advanced (since OpenGL 1.2)
  - Define (transmit) array of vertices, colors, normals
  - Draw using index into array(s)
  - Vertex sharing for efficient operations
- Not needed for first assignment



Outline

- Client/Server Model
- Callbacks
- Double Buffering
- Hidden Surface Removal
- Simple Transformations
- Example

GLUT Program with Callbacks



Main Event Loop

- Standard technique for interaction
  (GLUT, Qt, wxWidgets, ...)
- Main loop processes events
- Dispatch to functions specified by client
- Callbacks also common in operating systems
- “Poor man’s functional programming”

Types of Callbacks

- Display ( ) : when window must be drawn
- Idle ( ) : when no other events to be handled
- Keyboard (unsigned char key, int x, int y) : key pressed
- Menu (...) : after selection from menu
- Mouse (int button, int state, int x, int y) : mouse button
- Motion (...) : mouse movement
- Reshape (int w, int h) : window resize
- Any callback can be NULL

Outline

- Client/Server Model
- Callbacks
- Double Buffering
- Hidden Surface Removal
- Simple Transformations
- Example

Screen Refresh

- Common: 60-100 Hz
- Flicker if drawing overlaps screen refresh
- Problem during animation
- Solution: use two separate frame buffers:
  - Draw into one buffer
  - Swap and display, while drawing into other buffer
- Desirable frame rate >= 30 fps (frames/second)

Enabling Single/Double Buffering

- glutInitDisplayMode(GLUT_SINGLE);
- glutInitDisplayMode(GLUT_DOUBLE);

- Single buffering:
  Must call glFinish() at the end of Display()
- Double buffering:
  Must call glutSwapBuffers() at the end of Display()

- Must call glutPostRedisplay() at the end of Idle()

- If something in OpenGL has no effect or does not work, check the modes in glutInitDisplayMode

Outline

- Client/Server Model
- Callbacks
- Double Buffering
- Hidden Surface Removal
- Simple Transformations
- Example

Hidden Surface Removal

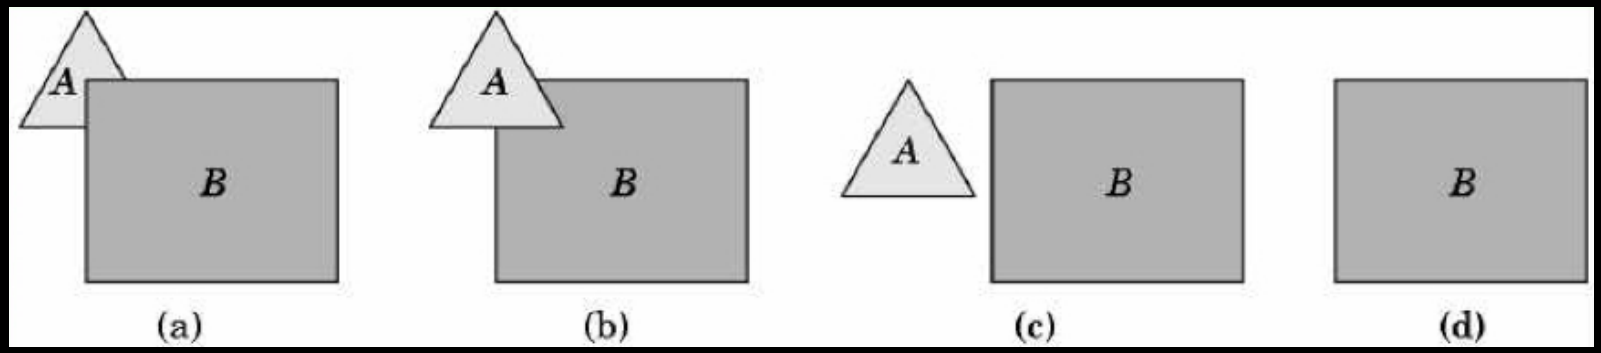
- Classic problem of computer graphics
- What is visible after clipping and projection?

- Object-space vs image-space approaches
- Object space: depth sort (Painter's algorithm)
- Image space: *z-buffer* algorithm

- Related: back-face culling

Object-Space Approach

- Consider objects pairwise

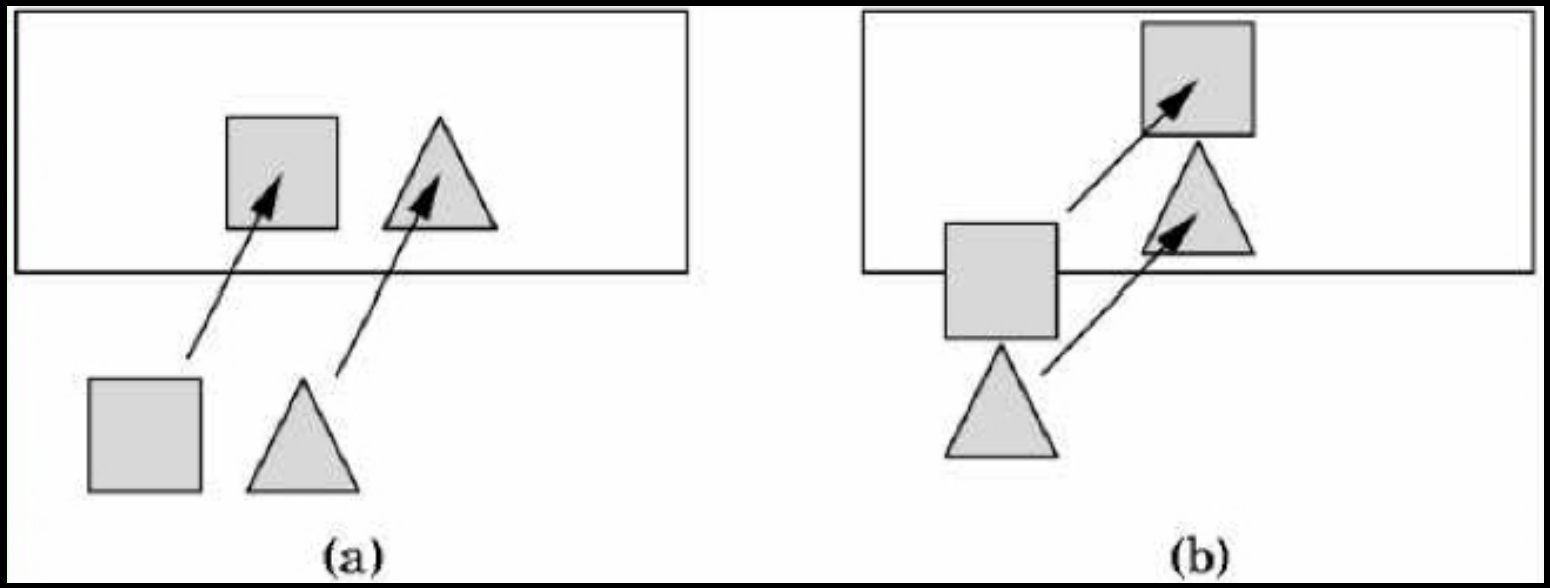


- Complexity $O(k^2)$ where k = # of objects
- Painter's algorithm: render back-to-front
- "Paint" over invisible polygons
- How to sort and how to test overlap?

Depth Sorting

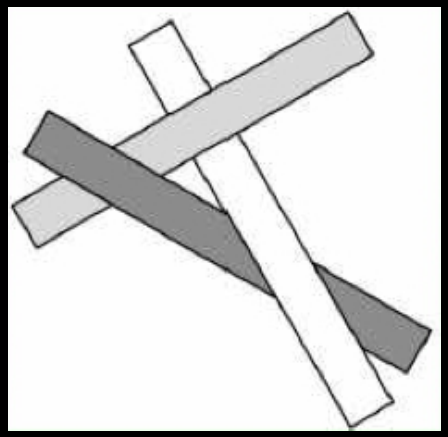
- First, sort by furthest distance z from viewer
- If minimum depth of A is greater than maximum depth of B, A can be drawn before B

- If either x or y extents do not overlap, A and B can be drawn independently

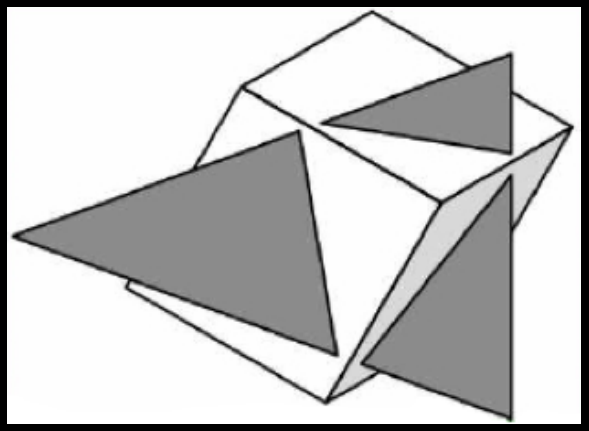


Some Difficult Cases

- Sometimes cannot sort polygons!



Cyclic overlap



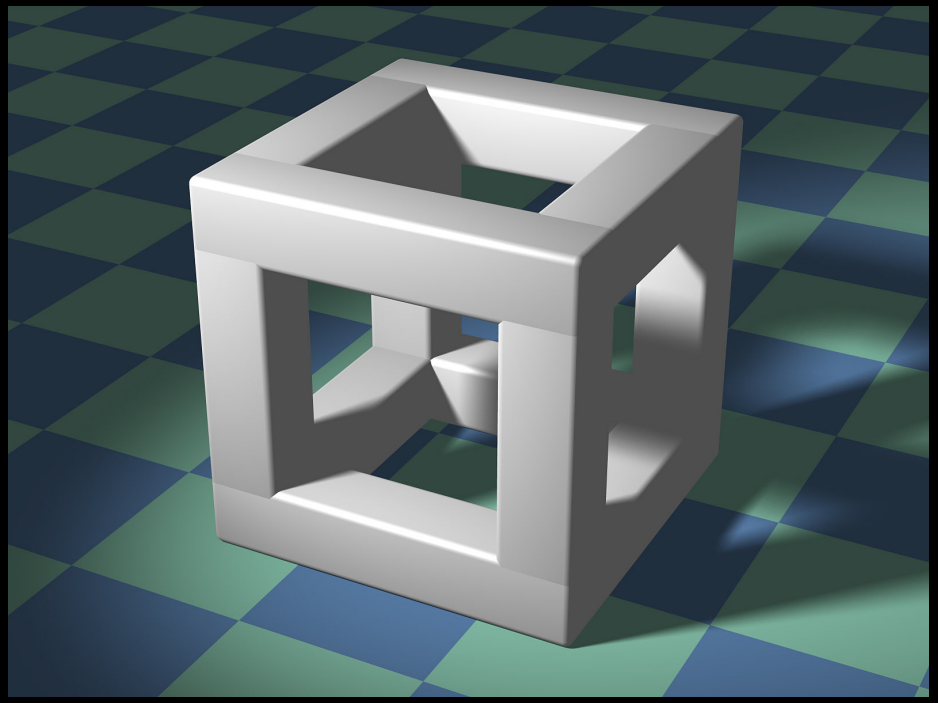
Piercing Polygons

- One solution: compute intersections & subdivide
- Do while rasterizing (difficult in object space)

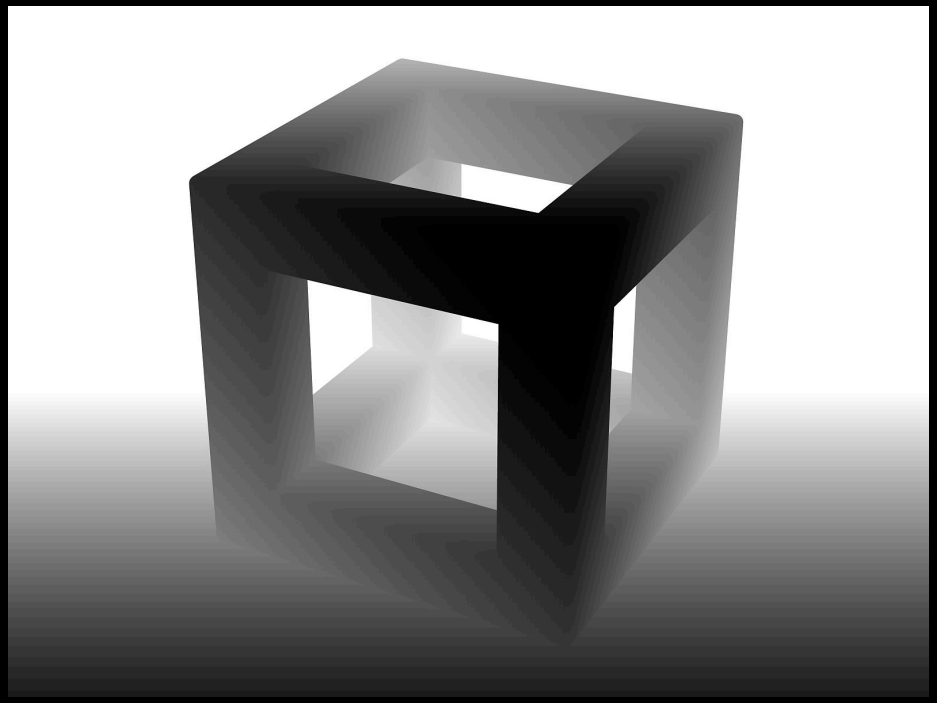
Painter's Algorithm Assessment

- Strengths
  - Simple (most of the time)
  - Handles transparency well
  - Sometimes, no need to sort (e.g., heightfield)
- Weaknesses
  - Clumsy when geometry is complex
  - Sorting can be expensive
- Usage
  - PostScript interpreters
  - OpenGL: not supported
    (must implement Painter's Algorithm manually)

Image-space approach



3D geometry



Depth image

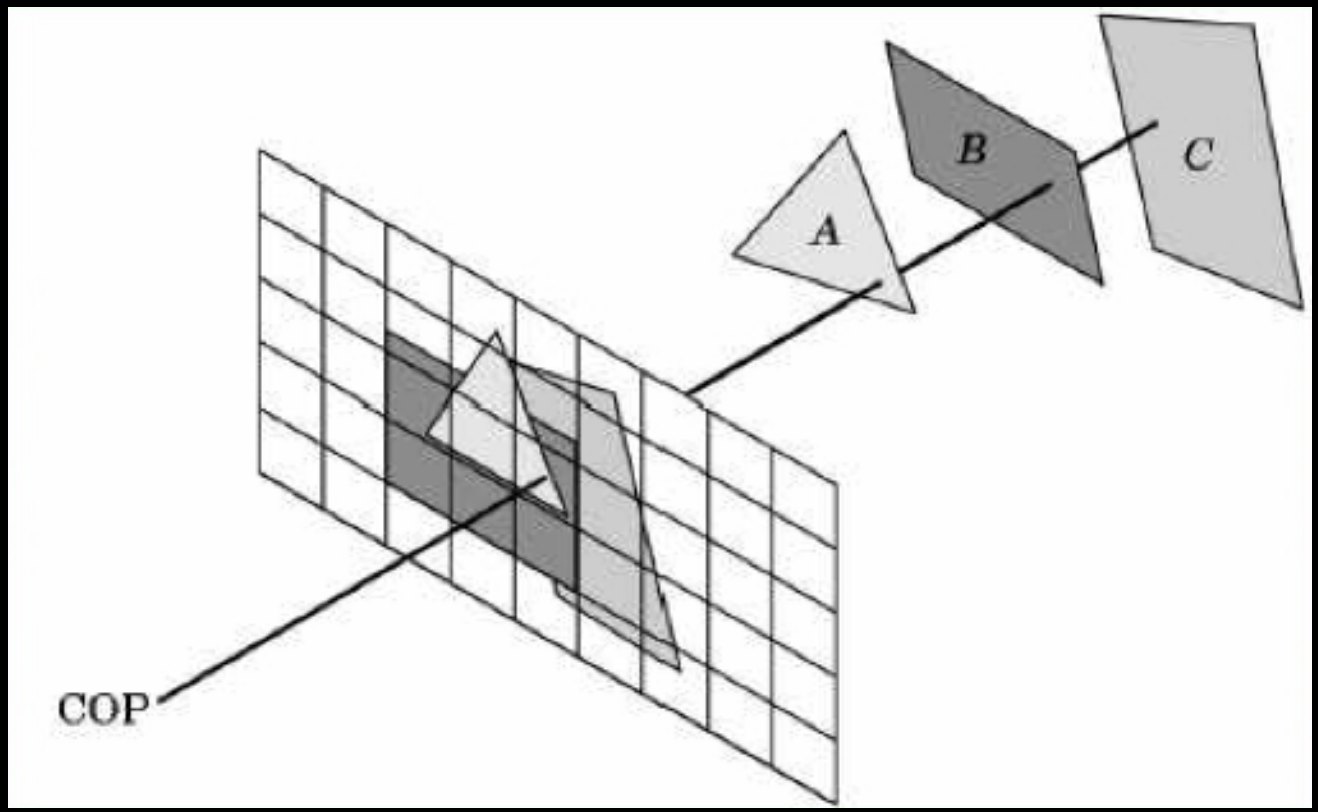
darker color is closer

Source: Wikipedia

Depth sensor camera

Image-Space Approach

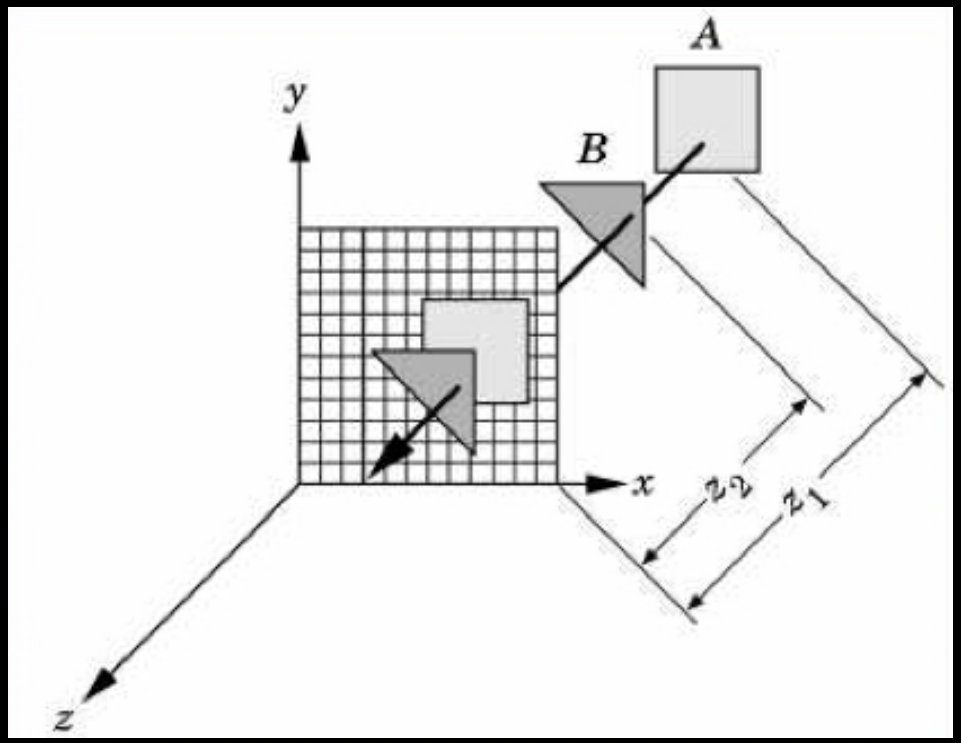
- Raycasting: intersect ray with polygons



- O(k) worst case (often better)
- Images can be more jagged (need anti-aliasing)

The z-Buffer Algorithm

- z-buffer stores depth values z for each pixel
- Before writing a pixel into framebuffer:
  - Compute distance z of pixel from viewer
  - If closer, write and update z-buffer, otherwise discard



z-Buffer Algorithm Assessment

- Strengths
  - Simple (no sorting or splitting)
  - Independent of geometric primitives
- Weaknesses
  - Memory intensive (but memory is cheap now)
  - Tricky to handle transparency and blending
  - Depth-ordering artifacts
- Usage
  - z-Buffering comes standard with OpenGL; disabled by default; must be enabled

Depth Buffer in OpenGL

- glutInitDisplayMode(GLUT_DOUBLE | GLUT_RGBA | GLUT_DEPTH);
- glEnable (GL_DEPTH_TEST);

- Inside Display():

  glClear (GL_DEPTH_BUFFER_BIT);

- Remember all of these!
- Some “tricks” use z-buffer in read-only mode

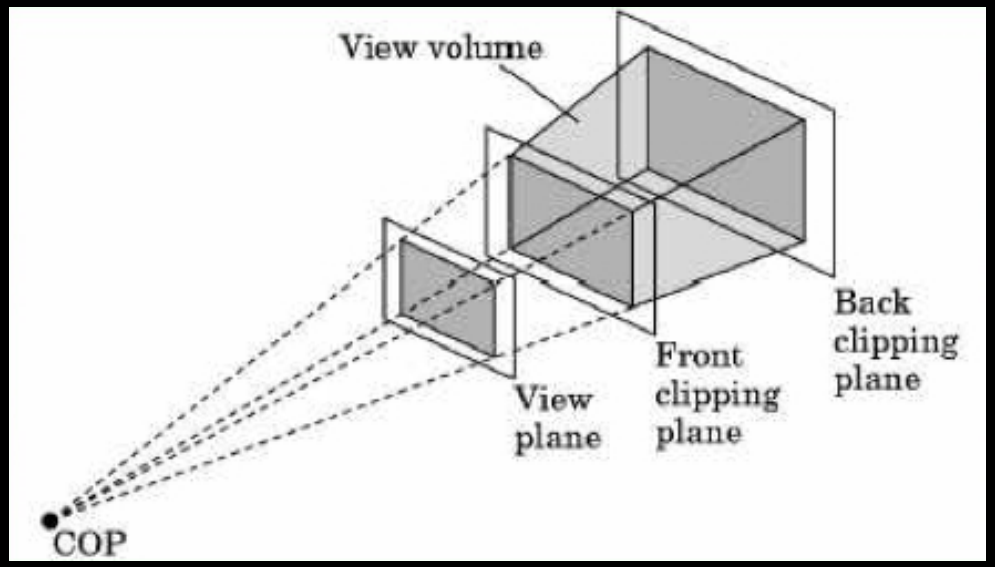
Outline

- Client/Server Model
- Callbacks
- Double Buffering
- Hidden Surface Removal
- Simple Transformations
- Example

Specifying the Viewing Volume

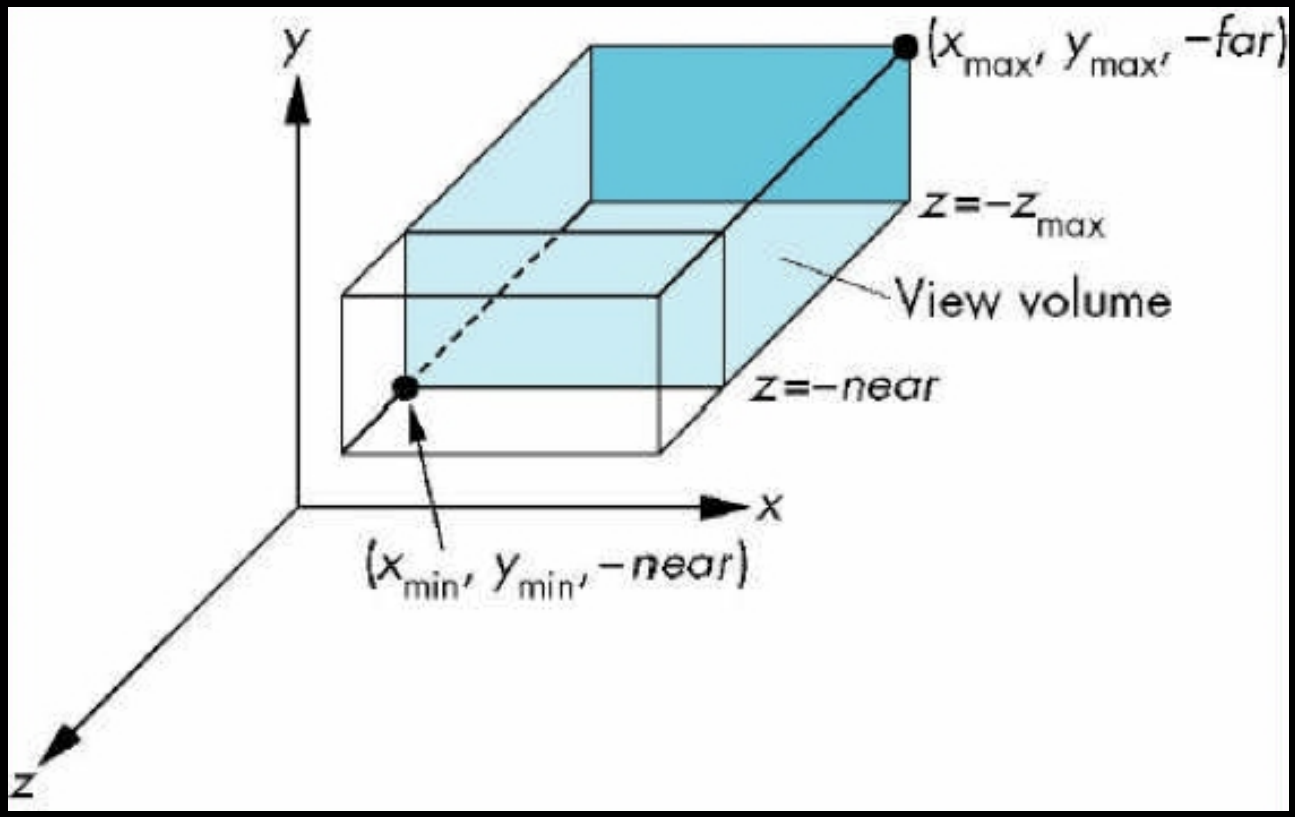
- Clip everything not in viewing volume
- Separate matrices for transformation and projection

```
glMatrixMode (GL_PROJECTION);
glLoadIdentity();
... Set viewing volume ...
glMatrixMode(GL_MODELVIEW);
```



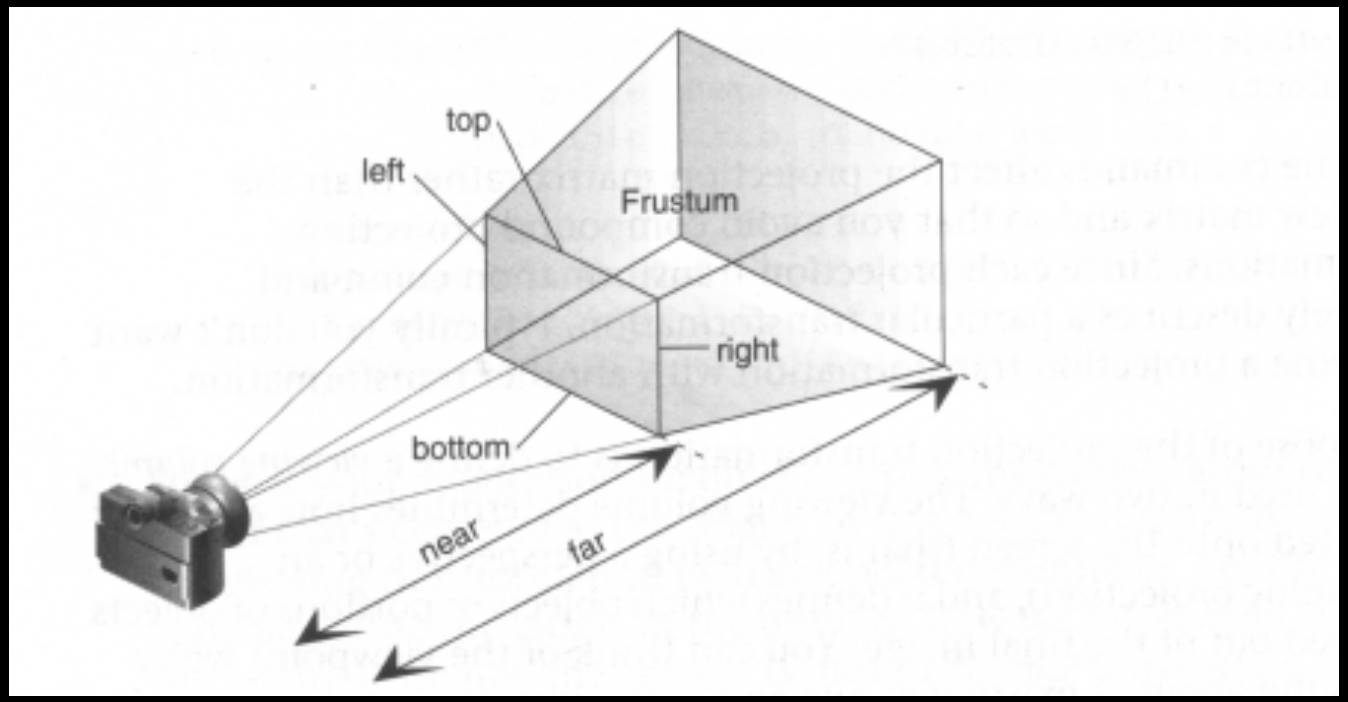
Parallel Viewing

- Orthographic projection
- Camera points in negative z direction
- glOrtho(xmin, xmax, ymin, ymax, near, far)



Perspective Viewing

- Slightly more complex
- glFrustum(left, right, bottom, top, near, far)



Simple Transformations

- Rotate by given angle (in degrees) about axis given by (x, y, z)

```
glRotate{fd}(angle, x, y, z);
```

- Translate by the given x, y, and z values

```
glTranslate{fd}(x, y, z);
```

- Scale with a factor in the x, y, and z direction

```
glScale{fd}(x, y, z);
```

Outline

- Client/Server Model
- Callbacks
- Double Buffering
- Hidden Surface Removal
- Simple Transformations
- Example

Example: Rotating Color Cube

- Adapted from [Angel, Ch. 4]

- Problem:
  - Draw a color cube
  - Rotate it about x, y, or z axis, depending on left, middle or right mouse click
  - Stop when space bar is pressed
  - Quit when q or Q is pressed

Step 1: Defining the Vertices

- Use parallel arrays for vertices and colors

```
/* vertices of cube about the origin */
GLfloat vertices[8][3] =
  {{-1.0, -1.0, -1.0}, {1.0, -1.0, -1.0},
   {1.0, 1.0, -1.0}, {-1.0, 1.0, -1.0}, {-1.0, -1.0, 1.0},
   {1.0, -1.0, 1.0}, {1.0, 1.0, 1.0}, {-1.0, 1.0, 1.0}};

/* colors to be assigned to vertices */
GLfloat colors[8][3] =
  {{0.0, 0.0, 0.0}, {1.0, 0.0, 0.0},
   {1.0, 1.0, 0.0}, {0.0, 1.0, 0.0}, {0.0, 0.0, 1.0},
   {1.0, 0.0, 1.0}, {1.0, 1.0, 1.0}, {0.0, 1.0, 1.0}};
```

Step 2: Set Up z-buffer and Double Buffering

```
int main(int argc, char **argv)
{
    glutInit(&argc, argv);
    /* double buffering for smooth animation */
    glutInitDisplayMode
     (GLUT_DOUBLE | GLUT_DEPTH | GLUT_RGB);
    ...     /* window creation and callbacks here */
    glEnable(GL_DEPTH_TEST);
    glutMainLoop();
    return(0);
}
```

Step 3: Install Callbacks

- Create window and set callbacks

```
glutInitWindowSize(500, 500);
glutCreateWindow("cube");
glutReshapeFunc(myReshape);
glutDisplayFunc(display);
glutIdleFunc(spinCube);
glutMouseFunc(mouse);
glutKeyboardFunc(keyboard);
```

Step 4: Reshape Callback

- Set projection and viewport, preserve aspect ratio

```
void myReshape(int w, int h)
{
   GLfloat aspect = (GLfloat) w / (GLfloat) h;
   glViewport(0, 0, w, h);
   glMatrixMode(GL_PROJECTION);
   glLoadIdentity();
   if (w <= h) /* aspect <= 1 */
     glOrtho(-2.0, 2.0, -2.0/aspect, 2.0/aspect, -10.0, 10.0);
   else /* aspect > 1 */
     glOrtho(-2.0*aspect, 2.0*aspect, -2.0, 2.0, -10.0, 10.0);
   glMatrixMode(GL_MODELVIEW);
}
```

Step 5: Display Callback

- Clear, rotate, draw, flush, swap

```
GLfloat theta[3] = {0.0, 0.0, 0.0};

void display(void)
{
  glClear(GL_COLOR_BUFFER_BIT
            | GL_DEPTH_BUFFER_BIT);
  glLoadIdentity();
  glRotatef(theta[0], 1.0, 0.0, 0.0);
  glRotatef(theta[1], 0.0, 1.0, 0.0);
  glRotatef(theta[2], 0.0, 0.0, 1.0);
  colorcube();
  glutSwapBuffers();
}
```

Step 6: Drawing Faces

- Call face(a, b, c, d) with vertex index
- Orient consistently

```
void colorcube(void)
{
  face(0,3,2,1);
  face(2,3,7,6);
  face(0,4,7,3);
  face(1,2,6,5);
  face(4,5,6,7);
  face(0,1,5,4);
}
```

Step 7: Drawing a Face

- Use vector form of primitives and attributes

```
void face(int a, int b, int c, int d)
{
  glBegin(GL_POLYGON);
    glColor3fv(colors[a]);
    glVertex3fv(vertices[a]);
    glColor3fv(colors[b]);
    glVertex3fv(vertices[b]);
    glColor3fv(colors[c]);
    glVertex3fv(vertices[c]);
    glColor3fv(colors[d]);
    glVertex3fv(vertices[d]);
  glEnd();
}
```

Step 8: Animation

- Set idle callback

```
GLfloat delta = 2.0;
GLint axis = 2;
void spinCube()
{
  /* spin the cube delta degrees about selected axis */
  theta[axis] += delta;
  if (theta[axis] > 360.0) theta[axis] -= 360.0;

  /* display result (do not forget this!) */
  glutPostRedisplay();
}
```

Step 9: Change Axis of Rotation

- Mouse callback

```
void mouse(int btn, int state, int x, int y)
{
   if ((btn==GLUT_LEFT_BUTTON) && (state == GLUT_DOWN))
      axis = 0;

   if ((btn==GLUT_MIDDLE_BUTTON) && (state == GLUT_DOWN))
      axis = 1;

   if ((btn==GLUT_RIGHT_BUTTON) && (state == GLUT_DOWN))
      axis = 2;
}
```

Step 10: Toggle Rotation or Exit

- Keyboard callback

```
void keyboard(unsigned char key, int x, int y)
{
  if (key=='q' || key == 'Q')
    exit(0);
  if (key==' ')
    stop = !stop;
  if (stop)
    glutIdleFunc(NULL);
  else
    glutIdleFunc(spinCube);
}
```

Summary

- Client/Server Model
- Callbacks
- Double Buffering
- Hidden Surface Removal
- Simple Transformations
- Example

Announcements

- Assignment 1 will be posted this week
- Microsoft Visual Studio (Windows) access enabled via Microsoft's MSDN
- Please start early
- Check web page for instructions
