

Viewing and Projection

Shear Transformation
Camera Positioning
Simple Parallel Projections
Simple Perspective Projections
[Angel, Ch. 4]

Jernej Barbic
University of Southern California

1

Reminder: Affine Transformations

- Given a point $[x \ y \ z]$, form homogeneous coordinates $[x \ y \ z \ 1]$.

$$\begin{bmatrix} x' \\ y' \\ z' \\ 1 \end{bmatrix} = \begin{bmatrix} m_{11} & m_{12} & m_{13} & m_{14} \\ m_{21} & m_{22} & m_{23} & m_{24} \\ m_{31} & m_{32} & m_{33} & m_{34} \\ m_{41} & m_{42} & m_{43} & m_{44} \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

- The transformed point is $[x' \ y' \ z']$.

2

Transformation Matrices in OpenGL

- Transformation matrices in OpenGL are vectors of 16 values (column-major matrices)

$m = \{m_1, m_2, \dots, m_{16}\}$ represents

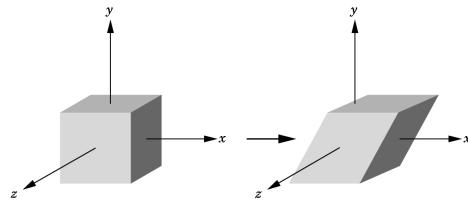

$$\begin{bmatrix} m_1 & m_5 & m_9 & m_{13} \\ m_2 & m_6 & m_{10} & m_{14} \\ m_3 & m_7 & m_{11} & m_{15} \\ m_4 & m_8 & m_{12} & m_{16} \end{bmatrix}$$

- Some books transpose all matrices!

3

Shear Transformations

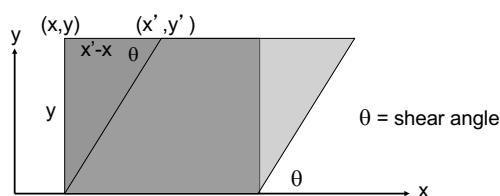

- x-shear scales x proportional to y
- Leaves y and z values fixed

4

Specification via Shear Angle

- $\cot(\theta) = (x' - x) / y$
- $x' = x + y \cot(\theta)$
- $y' = y$
- $z' = z$

5

Specification via Ratios

- For example, shear in both x and z direction
- Leave y fixed
- Slope α for x-shear, γ for z-shear
- Solve

$$H_{x,z}(\alpha, \gamma) \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x + \alpha y \\ y \\ z + \gamma y \\ 1 \end{bmatrix}$$

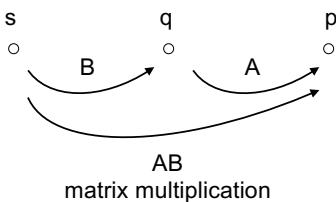

- Yields

$$H_{x,z}(\alpha, \gamma) = \begin{bmatrix} 1 & \alpha & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & \gamma & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

6

Composing Transformations

- Let $p = A q$, and $q = B s$.
- Then $p = (A B) s$.

7

Composing Transformations

- Fact: Every affine transformation is a composition of rotations, scalings, and translations
- So, how do we compose these to form an x-shear?
- Exercise!

8

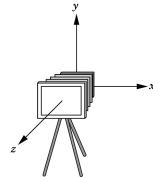

Outline

- Shear Transformation
- Camera Positioning
- Simple Parallel Projections
- Simple Perspective Projections

9

Transform Camera = Transform Scene

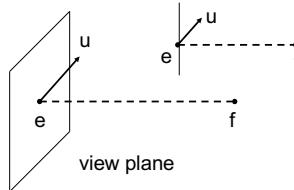

- Camera position is identified with a frame
- Either move and rotate the objects
- Or move and rotate the camera
- Initially, camera at origin, pointing in negative z-direction

10

The Look-At Function

- Convenient way to position camera
- `OpenGLMatrix::LookAt(ex, ey, ez, fx, fy, fz, ux, uy, uz); // core profile`
- `gluLookAt(ex, ey, ez, fx, fy, fz, ux, uy, uz); // compatibility profile`
- e = eye point
- f = focus point
- u = up vector

11

OpenGL code

```
void display()
{
    glClear(GL_COLOR_BUFFER_BIT|GL_DEPTH_BUFFER_BIT);
    openGLMatrix->SetMatrixMode(OpenGLMatrix::ModelView);
    openGLMatrix->LoadIdentity();
    openGLMatrix->LookAt(e_x, e_y, e_z, f_x, f_y, f_z, u_x, u_y, u_z);

    openGLMatrix->Translate(x, y, z); // transform the object
    ...
    float m[16]; // column-major
    openGLMatrix->GetMatrix(m); // fill "m" with the matrix entries
    glUniformMatrix4fv(h_modelViewMatrix, 1, GL_FALSE, m);
    renderBunny();
    glutSwapBuffers();
}
```

12

Implementing the Look-At Function

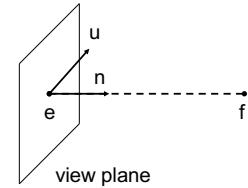

Plan:

1. Transform world frame to camera frame
 - Compose a rotation R with translation T
 - $W = TR$
2. Invert W to obtain viewing transformation V
 - $V = W^{-1} = (TR)^{-1} = R^{-1}T^{-1}$
 - Derive R, then T, then R^{-1} , then T^{-1}

13

World Frame to Camera Frame I

- Camera points in negative z direction
- $n = (f - e) / |f - e|$ is unit normal to view plane
- Therefore, R maps $[0 \ 0 \ -1]^T$ to $[n_x \ n_y \ n_z]^T$

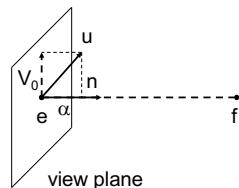

14

World Frame to Camera Frame II

- R maps $[0,1,0]^T$ to projection of u onto view plane
- This projection v equals:

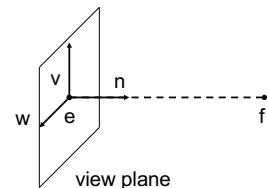

- $\alpha = (u \cdot n) / |n| = u \cdot n$
- $v_0 = u - \alpha n$
- $v = v_0 / |v_0|$

15

World Frame to Camera Frame III

- Set w to be orthogonal to n and v
- $w = n \times v$
- $(w, v, -n)$ is right-handed

16

Summary of Rotation

- gluLookAt($e_x, e_y, e_z, f_x, f_y, f_z, u_x, u_y, u_z$);
- $n = (f - e) / |f - e|$
- $v = (u - (u \cdot n) n) / |u - (u \cdot n) n|$
- $w = n \times v$
- Rotation must map:
 - $(1,0,0)$ to w
 - $(0,1,0)$ to v
 - $(0,0,-1)$ to n

$$\begin{bmatrix} w_x & v_x & -n_x & 0 \\ w_y & v_y & -n_y & 0 \\ w_z & v_z & -n_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

17

World Frame to Camera Frame IV

- Translation of origin to e = $[e_x \ e_y \ e_z \ 1]^T$

$$T = \begin{bmatrix} 1 & 0 & 0 & e_x \\ 0 & 1 & 0 & e_y \\ 0 & 0 & 1 & e_z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

18

Camera Frame to Rendering Frame

- $V = W^{-1} = (T R)^{-1} = R^{-1} T^{-1}$

- R is rotation, so $R^{-1} = R^T$

$$R^{-1} = \begin{bmatrix} w_x & w_y & w_z & 0 \\ v_x & v_y & v_z & 0 \\ -n_x & -n_y & -n_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

- T is translation, so T^{-1} negates displacement

$$T^{-1} = \begin{bmatrix} 1 & 0 & 0 & -e_x \\ 0 & 1 & 0 & -e_y \\ 0 & 0 & 1 & -e_z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

19

Putting it Together

- Calculate $V = R^{-1} T^{-1}$

$$V = \begin{bmatrix} w_x & w_y & w_z & -w_x e_x - w_y e_y - w_z e_z \\ v_x & v_y & v_z & -v_x e_x - v_y e_y - v_z e_z \\ -n_x & -n_y & -n_z & n_x e_x + n_y e_y + n_z e_z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

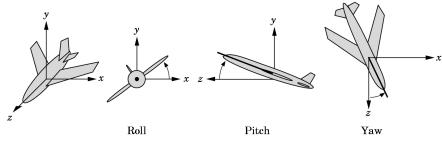

- This is different from book [Angel, Ch. 5.3.2]

- There, u, v, n are right-handed (here: $u, v, -n$)

20

Other Viewing Functions

- Roll (about z), pitch (about x), yaw (about y)

- Assignment 2 poses a related problem

21

Outline

- Shear Transformation
- Camera Positioning
- Simple Parallel Projections
- Simple Perspective Projections

22

Projection Matrices

- Recall geometric pipeline

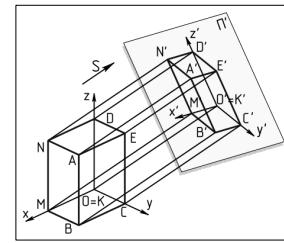

- Projection takes 3D to 2D
- Projections are not invertible
- Projections are described by a 4x4 matrix
- Homogenous coordinates crucial
- Parallel and perspective projections

23

Parallel Projection

- Project 3D object to 2D via parallel lines
- The lines are not necessarily orthogonal to projection plane

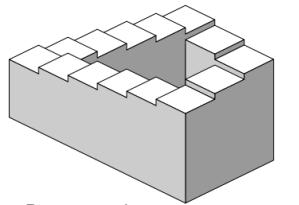

source: Wikipedia

24

Parallel Projection

- Problem: objects far away do not appear smaller
- Can lead to “impossible objects” :

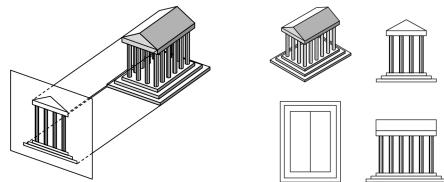

Penrose stairs

source: Wikipedia

25

Orthographic Projection

- A special kind of parallel projection: projectors perpendicular to projection plane
- Simple, but not realistic
- Used in blueprints (multiview projections)

26

Orthographic Projection Matrix

- Project onto $z = 0$
- $x_p = x, y_p = y, z_p = 0$
- In homogenous coordinates

$$\begin{array}{ccc} \text{Diagram showing a 3D point } (x, y, z) \text{ being projected onto the } z=0 \text{ plane at } (x_p, y_p, 0). & & \left[\begin{array}{c} x_p \\ y_p \\ z_p \\ 1 \end{array} \right] = \left[\begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{array} \right] \left[\begin{array}{c} x \\ y \\ z \\ 1 \end{array} \right] \end{array}$$

27

Perspective

- Perspective characterized by foreshortening
- More distant objects appear smaller
- Parallel lines appear to converge
- Rudimentary perspective in cave drawings:

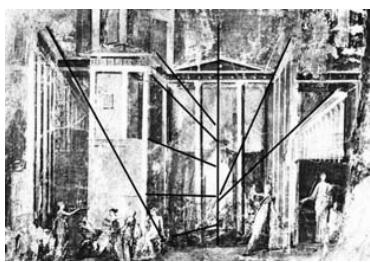

Lascaux, France

28

Discovery of Perspective

- Foundation in geometry (Euclid)

Mural from Pompeii, Italy

29

Middle Ages

- Art in the service of religion
- Perspective abandoned or forgotten

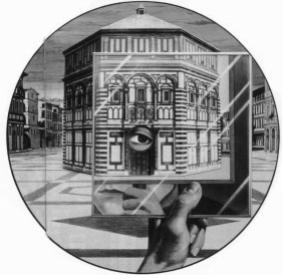

Ottoman manuscript,
ca. 1000

30

Renaissance

- Rediscovery, systematic study of perspective

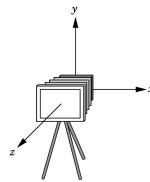

Filippo Brunelleschi
Florence, 1415

31

Projection (Viewing) in OpenGL

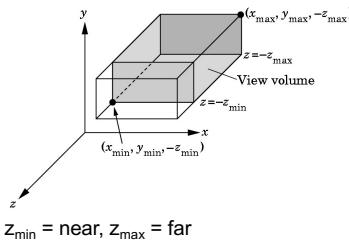

- Remember: camera is pointing in the negative z direction

32

Orthographic Viewing in OpenGL (compatibility profile)

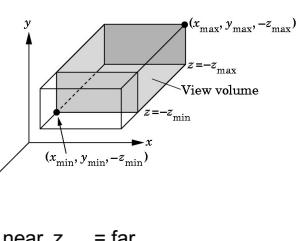

- `glOrtho(xmin, xmax, ymin, ymax, near, far)`

33

Orthographic Viewing in OpenGL (core profile)

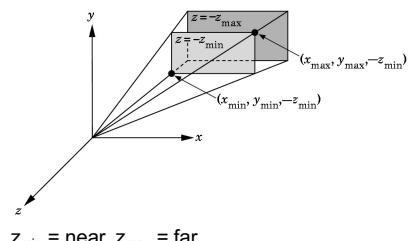

- `OpenGLMatrix::Ortho(xmin, xmax, ymin, ymax, near, far)`

34

Perspective Viewing in OpenGL

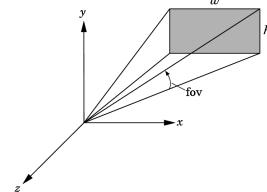

- Two interfaces: `glFrustum` and `gluPerspective`
- {`OpenGLMatrix::`, `glFrustum`}
 $xmin, xmax, ymin, ymax, near, far;$

35

Field of View Interface

- {`OpenGLMatrix::`, `glu`}`Perspective(fovy, aspectRatio, near, far);`
- near and far as before
- aspectRatio = w / h
- Fovy specifies field of view as height (y) angle

36

OpenGL code

```
void reshape(int x, int y)
{
    glViewport(0, 0, x, y);

    openGLMatrix->MatrixMode(GLMatrix::Projection);
    openGLMatrix->LoadIdentity();
    openGLMatrix->Perspective(60.0, 1.0 * x / y, 0.01, 10.0);
    openGLMatrix->MatrixMode(GLMatrix::ModelView);
}
```

37

OpenGL code

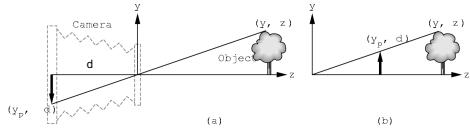

```
void displayFunc()
{
    ...

    openGLMatrix->SetMatrixMode(GLMatrix::Projection);
    float p[16]; // column-major
    openGLMatrix->GetMatrix(p);
    const GLboolean isRowMajor = false;
    glUniformMatrix4fv(h_projectionMatrix, 1, isRowMajor, p);
    ...

    renderBunny();
    glutSwapBuffers();
}
```

38

Perspective Viewing Mathematically

- d = focal length
- $y/z = y_p/d$ so $y_p = y/(z/d) = y d / z$
- Note that y_p is non-linear in the depth z !

39

Exploiting the 4th Dimension

- Perspective projection is not affine:

$$M \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} \frac{x}{z/d} \\ \frac{y}{z/d} \\ \frac{z}{d} \\ 1 \end{bmatrix} \text{ has no solution for } M$$

- Idea: exploit homogeneous coordinates

$$p = w \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \text{ for arbitrary } w \neq 0$$

40

Perspective Projection Matrix

- Use multiple of point

$$(z/d) \begin{bmatrix} \frac{x}{z/d} \\ \frac{y}{z/d} \\ \frac{z}{d} \\ 1 \end{bmatrix} = \begin{bmatrix} x \\ y \\ z \\ \frac{z}{d} \end{bmatrix}$$

- Solve

$$M \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x \\ y \\ z \\ \frac{z}{d} \end{bmatrix} \quad \text{with} \quad M = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & \frac{1}{d} & 0 \end{bmatrix}$$

41

Projection Algorithm

Input: 3D point (x,y,z) to project

1. Form $[x \ y \ z \ 1]^T$
2. Multiply M with $[x \ y \ z \ 1]^T$; obtaining $[X \ Y \ Z \ W]^T$
3. Perform perspective division:
 $X/W, Y/W, Z/W$

Output: $(X/W, Y/W, Z/W)$
(last coordinate will be d)

42

Perspective Division

- Normalize $[x \ y \ z \ w]^T$ to $[(x/w) \ (y/w) \ (z/w) \ 1]^T$

- Perform perspective division after projection

- Projection in OpenGL is more complex
(includes clipping)

43
