## Modeling Complex Shapes

Source: Wikipedia

- An equation for a sphere is possible, but how about an equation for a telephone, or a face?
- Complexity is achieved using simple pieces
  - polygons, parametric surfaces, or implicit surfaces
- Goals
  - Model *anything* with arbitrary precision (in principle)
  - Easy to build and modify
  - Efficient computations (for rendering, collisions, etc.)
  - Easy to implement (a minor consideration...)

2

## What do we need from shapes in Computer Graphics?

- Local control of shape for modeling
  - Ability to model what we need
  - Smoothness and continuity
  - Ability to evaluate derivatives
  - Ability to do collision detection
  - Ease of rendering
- No single technique solves all problems!

3

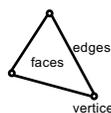

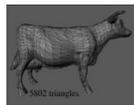

## Shape Representations

Polygon Meshes  
Parametric Surfaces  
Implicit Surfaces

4

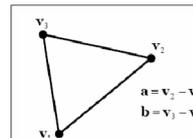

## Polygon Meshes

- Any shape can be modeled out of polygons
  - if you use enough of them...
- Polygons with how many sides?
  - Can use triangles, quadrilaterals, pentagons, ... n-gons
  - Triangles are most common.
  - When > 3 sides are used, ambiguity about what to do when polygon nonplanar, or concave, or self-intersecting.
- Polygon meshes are built out of
  - *vertices* (points)
  - *edges* (line segments between vertices)
  - *faces* (polygons bounded by edges)

5

## Normals

$$\mathbf{a} = \mathbf{v}_2 - \mathbf{v}_1$$

$$\mathbf{b} = \mathbf{v}_3 - \mathbf{v}_1$$

### Triangle defines unique plane

- can easily compute normal
- $$\mathbf{n} = \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{a} \times \mathbf{b}|}$$
- depends on vertex orientation!
  - clockwise order gives  $\mathbf{n}' = -\mathbf{n}$

### Vertex normals less well defined

- can average face normals
- works for smooth surfaces
- but not at sharp corners
  - think of a cube

6

## Where Meshes Come From

- Specify manually
  - Write out all polygons
  - Write some code to generate them
  - Interactive editing: move vertices in space
- Acquisition from real objects
  - Laser scanners, vision systems
  - Generate set of points on the surface
  - Need to convert to polygons

7

## Data Structures for Polygon Meshes

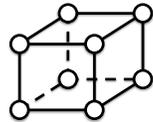

- Simplest (but dumb)
  - float triangle[n][3][3]; (each triangle stores 3 (x,y,z) points)
  - redundant: each vertex stored multiple times
- Vertex List, Face List
  - List of vertices, each vertex consists of (x,y,z) geometric (shape) info only
  - List of triangles, each a triple of vertex id's (or pointers) topological (connectivity, adjacency) info only

*Fine for many purposes, but finding the faces adjacent to a vertex takes  $O(F)$  time for a model with  $F$  faces. Such queries are important for topological editing.*
- Fancier schemes:
  - Store more topological info so adjacency queries can be answered in  $O(1)$  time.
  - *Winged-edge data structure* - edge structures contain all topological info (pointers to adjacent vertices, edges, and faces).

8

## A File Format for Polygon Models: OBJ

```
# OBJ file for a 2x2x2 cube
v -1.0 1.0 1.0
v -1.0 -1.0 1.0
v 1.0 -1.0 1.0
v 1.0 1.0 1.0
v -1.0 1.0 -1.0
v -1.0 -1.0 -1.0
v 1.0 -1.0 -1.0
v 1.0 1.0 -1.0
f 1 2 3 4
f 8 7 6 5
f 4 3 7 8
f 5 1 4 8
f 5 6 2 1
f 2 6 7 3
```

### Syntax:

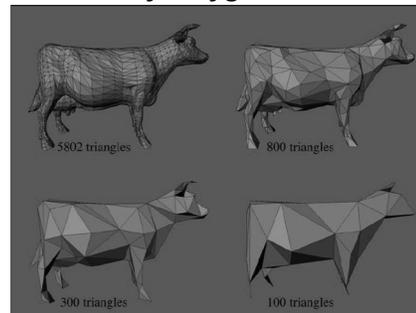

v x y z - a vertex at (x,y,z)

f  $V_1 V_2 \dots V_n$  - a face with vertices  $V_1, V_2, \dots V_n$

# anything - comment

9

## How Many Polygons to Use?

10

## Why Level of Detail?

- Different models for near and far objects
- Different models for rendering and collision detection
- Compression of data recorded from the real world

We need automatic algorithms for reducing the polygon count without

- losing key features
- getting artifacts in the silhouette
- popping

11

## Problems with Triangular Meshes?

- Need a lot of polygons to represent smooth shapes
- Need a lot of polygons to represent detailed shapes
- Hard to edit
- Need to move individual vertices
- Intersection test? Inside/outside test?

12

## Shape Representations

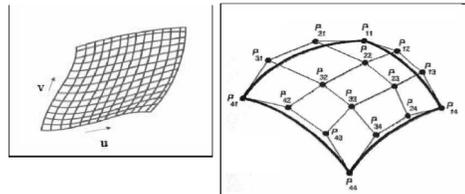

Polygon Meshes  
 Parametric Surfaces  
 Implicit Surfaces

13

## Parametric Surfaces

$$p(u,v) = [x(u,v), y(u,v), z(u,v)]$$

- e.g. plane, cylinder, bicubic surface, swept surface

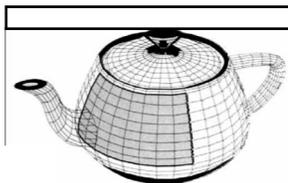

Bezier patch

14

## Parametric Surfaces

$$p(u,v) = [x(u,v), y(u,v), z(u,v)]$$

- e.g. plane, cylinder, bicubic surface, swept surface

the Utah teapot

15

## Parametric Surfaces

Why better than polygon meshes?

- Much more compact
- More convenient to control --- just edit control points
- Easy to construct from control points

What are the problems?

- Work well for smooth surfaces
- Must still split surfaces into discrete number of patches
- Rendering times are higher than for polygons
- Intersection test? Inside/outside test?

16

## Shape Representations

Polygon Meshes  
 Parametric Surfaces  
 Implicit Surfaces

17

## Two Ways to Define a Circle

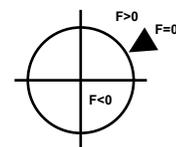

Parametric

$$x = f(u) = r \cos(u)$$

$$y = g(u) = r \sin(u)$$

Implicit

$$F(x,y) = x^2 + y^2 - r^2$$

18

## Implicit Surfaces

- well defined inside/outside
- polygons and parametric surfaces do not have this information
- Computing is hard: implicit functions for a cube? telephone?

- **Implicit surface:**  $F(x,y,z) = 0$ 
  - e.g. plane, sphere, cylinder, quadric, torus, blobby models
  - sphere with radius  $r$ :  $F(x,y,z) = x^2 + y^2 + z^2 - r^2 = 0$
  - terrible for iterating over the surface
  - great for intersections, inside/outside test

19

## Quadric Surfaces

$F(x,y,z) = ax^2 + by^2 + cz^2 + 2fyz + 2gzx + 2hxy + 2px + 2qy + 2rz + d = 0$

ellipsoid

hyperbolic paraboloid

elliptic paraboloid

double cone

hyperboloid of one sheet

hyperboloid of two sheets

20

## What Implicit Functions are Good For

Ray - Surface Intersection Test

Inside/Outside Test

21

## Surfaces from Implicit Functions

- Constant Value Surfaces are called (depending on whom you ask):
  - constant value surfaces
  - level sets
  - isosurfaces
- Nice Feature: you can add them! (and other tricks)
  - this merges the shapes
  - When you use this with spherical exponential potentials, it's called *Blobs*, *Metaballs*, or *Soft Objects*. Great for modeling animals.

22

## Blobby Models

Source: blender.org (2017)

23

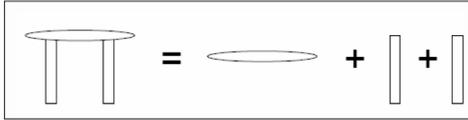

## How to draw implicit surfaces?

- It's easy to ray trace implicit surfaces
  - because of that easy intersection test
- Volume Rendering can display them
- Convert to polygons: the Marching Cubes algorithm
  - Divide space into cubes
  - Evaluate implicit function at each cube vertex
  - Do root finding or linear interpolation along each edge
  - Polygonize on a cube-by-cube basis

24

## Constructive Solid Geometry (CSG)

- Generate complex shapes with basic building blocks
- Machine an object - saw parts off, drill holes, glue pieces together

25

## Constructive Solid Geometry (CSG)

union

the merger  
of two objects  
into one

difference

the subtraction  
of one object  
from another

intersection

the portion  
common to  
both objects

Source: Wikipedia

26

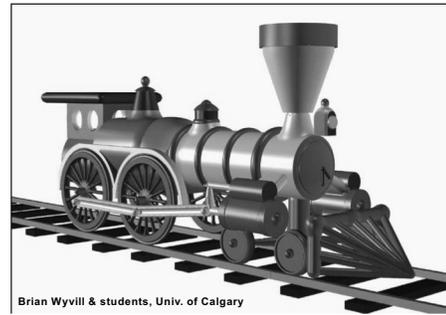

## Constructive Solid Geometry (CSG)

- Generate complex shapes with basic building blocks
- Machine an object - saw parts off, drill holes, glue pieces together
- This is sensible for objects that are actually made that way (human-made, particularly machined objects)

27

## A CSG Train

Brian Wyvill & students, Univ. of Calgary

28

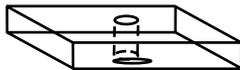

## Negative Objects

Use point-by-point boolean functions

- remove a volume by using a negative object
- e.g. drill a hole by subtracting a cylinder

To get

$\text{Inside}(\text{BLOCK-CYL}) = \text{Inside}(\text{BLOCK}) \text{ And } \text{Not}(\text{Inside}(\text{CYL}))$

29

## Set Operations

- UNION:  $\text{Inside}(A) \parallel \text{Inside}(B)$   
➢ Join A and B
- INTERSECTION:  $\text{Inside}(A) \ \&\& \ \text{Inside}(B)$   
➢ Chop off any part of A that sticks out of B
- SUBTRACTION:  $\text{Inside}(A) \ \&\& \ (\! \text{Inside}(B))$   
➢ Use B to Cut A

Examples:

- Use cylinders to drill holes
- Use rectangular blocks to cut slots
- Use half-spaces to cut planar faces
- Use surfaces swept from curves as jigsaws, etc.

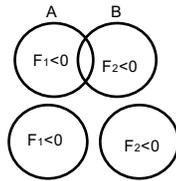

30

## Implicit Functions for Booleans

- Recall the implicit function for a solid:  $F(x,y,z) < 0$
- Boolean operations are replaced by arithmetic:
  - MAX replaces AND (intersection)
  - MIN replaces OR (union)
  - MINUS replaces NOT (unary subtraction)

- Thus

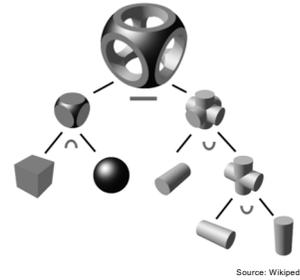

- $F(\text{Intersect}(A,B)) = \text{MAX}(F(A), F(B))$
- $F(\text{Union}(A,B)) = \text{MIN}(F(A), F(B))$
- $F(\text{Subtract}(A,B)) = \text{MAX}(F(A), -F(B))$

31

## CSG Trees

- Set operations yield tree-based representation

32

## Implicit Surfaces

- Good for smoothly blending multiple components
- Clearly defined solid along with its boundary
- Intersection test and Inside/outside test are easy
  
- Need to polygonize to render --- expensive
- Interactive control is not easy
- Fitting to real world data is not easy
- Always smooth

33

## Summary

- Polygonal Meshes
- Parametric Surfaces
- Implicit Surfaces
- Constructive Solid Geometry

34
