CS420 Assignment 3 Hints

Ray Tracing

Step 1: send rays

- Send out rays from camera position (0,0,0) pointing to -z
- Image size 640x480
 - For debugging, use smaller size

- Send out rays from camera position (0,0,0) pointing to -z
- Image size 640x480
 - For debugging, use smaller size

Step 2: Intersect with scene

- Sphere & triangle
- Analytical solution

Debugging

- Do step by step
 - Intersect with sphere, test code
 - Intersect with triangle, test code
 - Compute sphere color, test code
 - Compute triangle color, test code

Tips

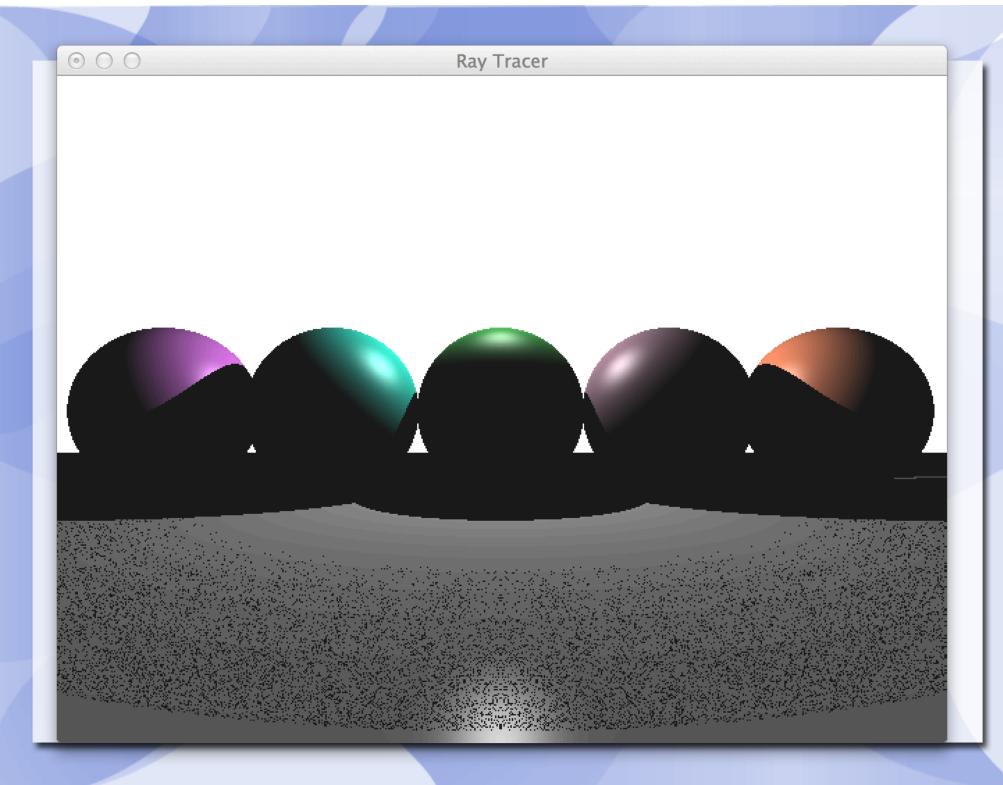

- Ensure B != 0 when dividing A / B
- Before calling sqrt(x), make sure x >= 0
- Remember to normalize the direction vector
- Remember to check len(dir) != 0 before dividing by the length

Tips

- Distinguish between normals:
 - normal of a triangle
 - vertex normal
 - normal interpolated from vertex normals

Tips

- Floating-point operations not accurate:
 - When computing shadow rays, use: distanceFromLightToFirstObject < distanceFromLightToTargetSurface – smallValue
 - Otherwise, artifacts appear... (see next image)

Extra Credits

- Super-sampling
 - anti-aliasing
 - can do adaptively: if some region is smooth, no need to super sampling
- Ray tracing
 - (1-ks)*localPhongColor + ks*colorOfReflectedRay
- You can also add refraction

Extra Credit (Cont'd)

- Animation
- Soft shadows
- Parallel computing for faster rendering
 - OpenMP: utilize multi-core CPUs
 - Cuda: use GPU to do parallel computing
