## OpenGL Transformations

2

## OpenGL Transformation Matrices

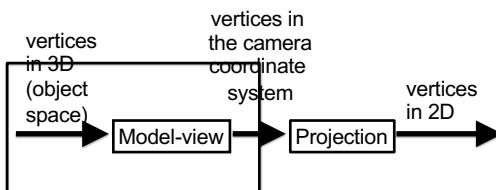

- Model-view matrix (4x4 matrix)
- Projection matrix (4x4 matrix)

3

## 4x4 Model-view Matrix (this lecture)

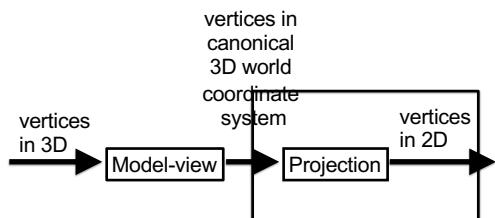

- Translate, rotate, scale objects
- Position the camera

4

## 4x4 Projection Matrix (next lecture)

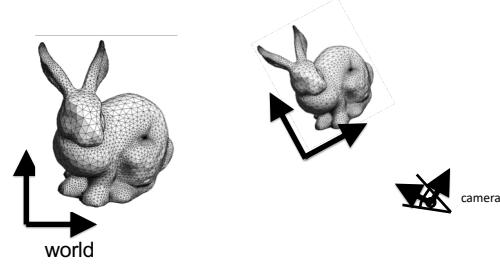

- Project from 3D to 2D

5

## 4x4 Model-view Matrix (this lecture)

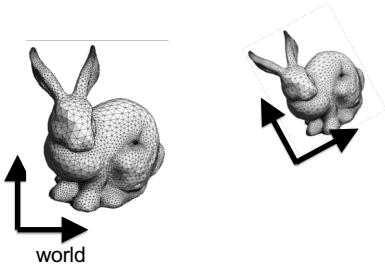

- Translate, rotate, scale objects in world space
- Position and orient the camera

6

### 4x4 Model Matrix

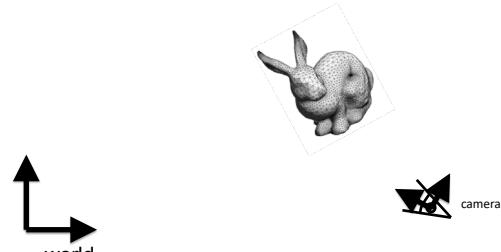

- Translate, rotate, scale objects in world space

7

### 4x4 View Matrix

- Position and orient the camera
- From world space to camera space

8

### OpenGL Transformation Matrices

- Manipulated separately in OpenGL
- Core profile: set them directly
- Compatibility profile: must set matrix mode

```
glMatrixMode(GL_MODELVIEW);  
glMatrixMode(GL_PROJECTION);
```

9

### Setting the Modelview Matrix: Core Profile

- Set identity:  
`openGLMatrix.SetMatrixMode(OpenGLMatrix::ModelView);  
openGLMatrix.LoadIdentity();`
- Use our openGLMatrix library functions:  
`openGLMatrix.Translate(dx, dy, dz);  
openGLMatrix.Rotate(angle, vx, vy, vz);  
openGLMatrix.Scale(sx, sy, sz);`
- Upload m to the GPU:  
`float m[16]; // column-major  
openGLMatrix.GetMatrix(m);  
GLboolean isRowMajor = GL_FALSE;  
glUniformMatrix4fv(h_modelViewMatrix, 1, isRowMajor, m);  
// note: h_modelViewMatrix is a handle of the shader  
modelview matrix variable (will discuss in Shaders lecture)`

### Setting the Modelview Matrix: Compatibility Profile

- Load or post-multiply

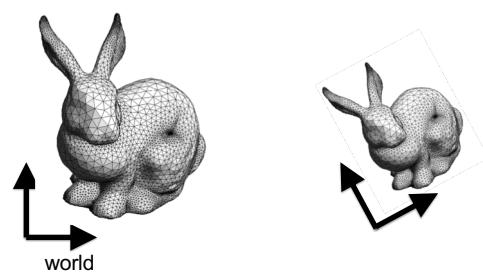

```
glMatrixMode(GL_MODELVIEW);  
glLoadIdentity(); // very common usage  
float m[16] = { ... };  
glLoadMatrixf(m); // rare, advanced  
glMultMatrixf(m); // rare, advanced
```

- Use library functions

```
glTranslatef(dx, dy, dz);  
glRotatef(angle, vx, vy, vz);  
glScalef(sx, sy, sz);
```

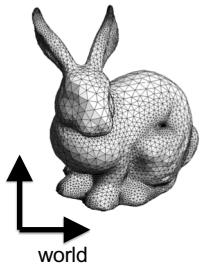

11

### Translated, rotated, scaled object

12

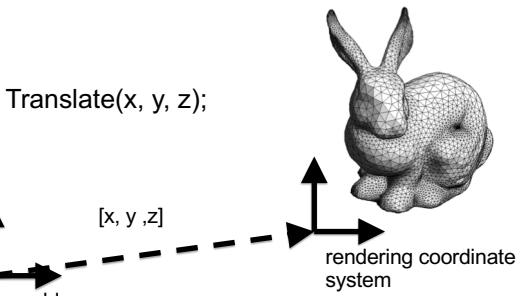

### The rendering coordinate system

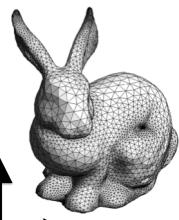

Initially (after LoadIdentity()):  
rendering coordinate system =  
world coordinate system

13

### The rendering coordinate system

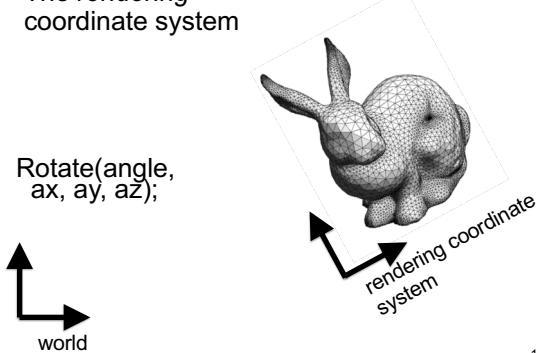

Translate(x, y, z);

14

### The rendering coordinate system

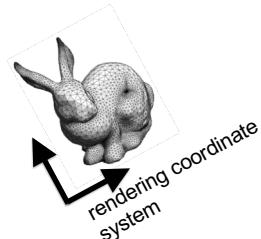

Rotate(angle,  
ax, ay, az);

world

15

### The rendering coordinate system

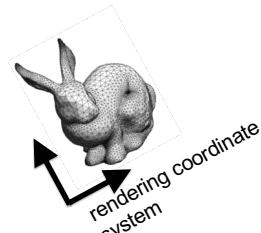

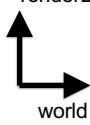

Scale(sx, sy, sz);

16

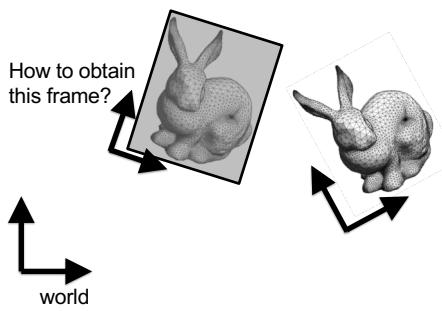

### OpenGL pseudo-code

```
MatrixMode(ModelView);
LoadIdentity();
Translate(x, y, z);
Rotate(angle, ax, ay, az);
Scale(sx, sy, sz);
glUniformMatrix4fv(...);
renderBunny();
```

17

### Rendering more objects

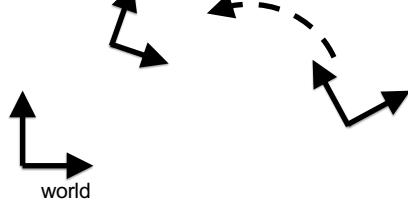

18

## Rendering more objects

### Solution 1:

Find Translate(...), Rotate(...), Scale(...)

How to obtain  
this frame?

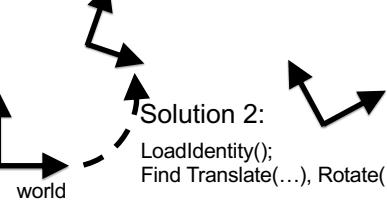

19

## Rendering more objects

How to obtain  
this frame?

### Solution 2:

LoadIdentity();  
Find Translate(...), Rotate(...), Scale(...)

20

## 3D Math Review

21

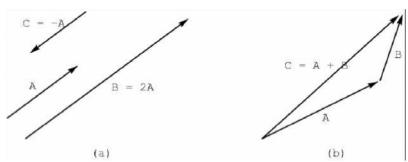

## Scalars

- Scalars  $\alpha, \beta, \gamma$  from a *scalar field*
- Operations  $\alpha+\beta, \alpha \cdot \beta, 0, 1, -\alpha, (\ )^{-1}$
- "Expected" laws apply
- Examples: rationals or reals with addition and multiplication

22

## Vectors

- Vectors  $u, v, w$  from a *vector space*
- Vector addition  $u + v$ , subtraction  $u - v$
- Zero vector  $\mathbf{0}$
- Scalar multiplication  $\alpha v$

23

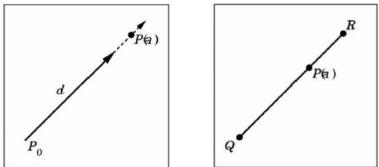

## Euclidean Space

- Vector space over real numbers
- Three-dimensional in computer graphics
- Dot product:  $\alpha = u \cdot v = u_1 v_1 + u_2 v_2 + u_3 v_3$
- $\mathbf{0} \cdot \mathbf{0} = 0$
- $u, v$  are *orthogonal* if  $u \cdot v = 0$
- $|v|^2 = v \cdot v$  defines  $|v|$ , the *length* of  $v$

24

## Lines and Line Segments

- Parametric form of line:  $P(\alpha) = P_0 + \alpha d$

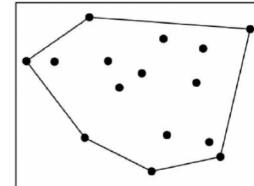

- Line segment between Q and R:  $P(\alpha) = (1-\alpha) Q + \alpha R$  for  $0 \leq \alpha \leq 1$

25

## Convex Hull

- Convex hull defined by  

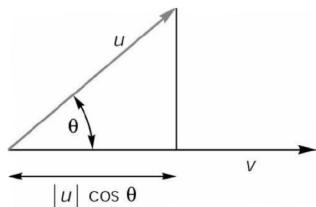

$$P = \alpha_1 P_1 + \dots + \alpha_n P_n$$
for  $\alpha_1 + \dots + \alpha_n = 1$   
and  $0 \leq \alpha_i \leq 1$ ,  $i = 1, \dots, n$

26

## Projection

- Dot product projects one vector onto another vector  
 $u \cdot v = u_1 v_1 + u_2 v_2 + u_3 v_3 = |u| |v| \cos(\theta)$   
 $\text{pr}_v u = (u \cdot v) v / |v|^2$

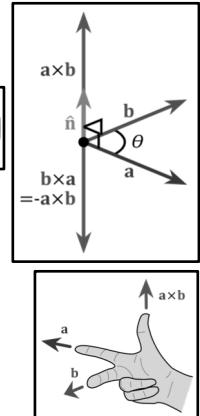

27

## Cross Product

$$\begin{pmatrix} a_1 \\ a_2 \\ a_3 \end{pmatrix} \times \begin{pmatrix} b_1 \\ b_2 \\ b_3 \end{pmatrix} = \begin{pmatrix} a_2 b_3 - a_3 b_2 \\ a_3 b_1 - a_1 b_3 \\ a_1 b_2 - a_2 b_1 \end{pmatrix}$$

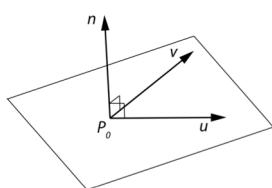

- $|a \times b| = |a| |b| |\sin(\theta)|$
- Cross product is perpendicular to both a and b
- Right-hand rule

Source: Wikipedia

## Plane

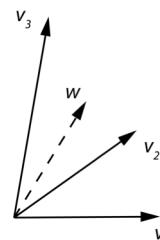

- Plane defined by point  $P_0$  and vectors  $u$  and  $v$
- $u$  and  $v$  should not be parallel
- Parametric form:  
 $T(\alpha, \beta) = P_0 + \alpha u + \beta v$   
( $\alpha$  and  $\beta$  are scalars)
- $n = u \times v / |u \times v|$  is the normal
- $n \cdot (P - P_0) = 0$  if and only if  $P$  lies in plane

29

## Coordinate Systems

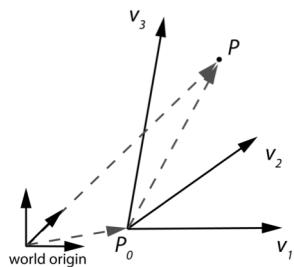

- Let  $v_1, v_2, v_3$  be three linearly independent vectors in a 3-dimensional vector space
- Can write any vector  $w$  as  
 $w = \alpha_1 v_1 + \alpha_2 v_2 + \alpha_3 v_3$   
for some scalars  $\alpha_1, \alpha_2, \alpha_3$

30

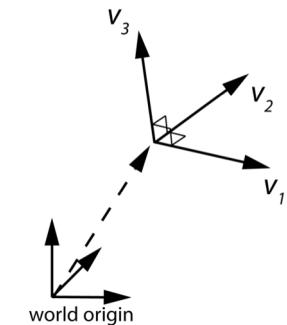

## Frames

- Frame = origin  $P_0$  + coordinate system
- Any point  $P = P_0 + \alpha_1 v_1 + \alpha_2 v_2 + \alpha_3 v_3$

31

## In Practice, Frames are Often Orthogonal

32

## Representing 3D transformations (and model-view matrices)

34

## Linear Transformations

- $3 \times 3$  matrices represent linear transformations  $\mathbf{a} = \mathbf{Mb}$
- Can represent rotation, scaling, and reflection
- Cannot represent translation

$$M = \begin{bmatrix} \gamma_{11} & \gamma_{12} & \gamma_{13} \\ \gamma_{21} & \gamma_{22} & \gamma_{23} \\ \gamma_{31} & \gamma_{32} & \gamma_{33} \end{bmatrix}$$

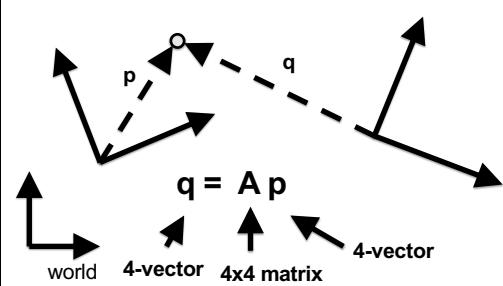

35

In order to represent rotations,  
scales AND translations:  
Homogeneous Coordinates

- Augment  $[\alpha_1 \ \alpha_2 \ \alpha_3]^T$  by adding a fourth component (1):  
 $\mathbf{p} = [\alpha_1 \ \alpha_2 \ \alpha_3 \ 1]^T$
- Homogeneous property:  
 $\mathbf{p} = [\alpha_1 \ \alpha_2 \ \alpha_3 \ 1]^T = [\beta\alpha_1 \ \beta\alpha_2 \ \beta\alpha_3 \ \beta]^T$ ,  
for any scalar  $\beta \neq 0$

36

Homogeneous coordinates  
are transformed by  $4 \times 4$  matrices

37

## Affine Transformations (4x4 matrices)

- Translation
- Rotation
- Scaling
- Any composition of the above
- Later: projective (perspective) transformations
  - Also expressible as 4 x 4 matrices!

38

## Translation

- $\mathbf{q} = \mathbf{p} + \mathbf{d}$  where  $\mathbf{d} = [\alpha_x \ \alpha_y \ \alpha_z \ 0]^T$
- $\mathbf{p} = [x \ y \ z \ 1]^T$
- $\mathbf{q} = [x' \ y' \ z' \ 1]^T$
- Express in matrix form  $\mathbf{q} = \mathbf{T} \mathbf{p}$  and solve for  $\mathbf{T}$

$$T = \begin{bmatrix} 1 & 0 & 0 & \alpha_x \\ 0 & 1 & 0 & \alpha_y \\ 0 & 0 & 1 & \alpha_z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

39

## Scaling

- $x' = \beta_x x$
- $y' = \beta_y y$
- $z' = \beta_z z$
- Express as  $\mathbf{q} = \mathbf{S} \mathbf{p}$  and solve for  $\mathbf{S}$

$$S = \begin{bmatrix} \beta_x & 0 & 0 & 0 \\ 0 & \beta_y & 0 & 0 \\ 0 & 0 & \beta_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

40

## Rotation in 2 Dimensions

- Rotation by  $\theta$  about the origin
- $x' = x \cos \theta - y \sin \theta$
- $y' = x \sin \theta + y \cos \theta$
- Express in matrix form:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) \\ \sin(\theta) & \cos(\theta) \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

- Note that the determinant is 1

41

## Rotation in 3 Dimensions

- Orthogonal matrices:

$$RR^T = R^T R = I$$

$$\det(R) = 1$$

- Affine transformation:

$$A = \begin{bmatrix} R_{11} & R_{12} & R_{13} & 0 \\ R_{21} & R_{22} & R_{23} & 0 \\ R_{31} & R_{32} & R_{33} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

42

## Affine Matrices are Composed by Matrix Multiplication

- $\mathbf{A} = \mathbf{A}_1 \mathbf{A}_2 \mathbf{A}_3$
- Applied from right to left
- $\mathbf{A} \mathbf{p} = (\mathbf{A}_1 \mathbf{A}_2 \mathbf{A}_3) \mathbf{p} = \mathbf{A}_1 (\mathbf{A}_2 (\mathbf{A}_3 \mathbf{p}))$
- Compatibility mode:  
When calling `glTranslate3f`, `glRotatef`, or `glScalef`, OpenGL forms the corresponding 4x4 matrix, and multiplies the current modelview matrix with it.

43

## Summary

- OpenGL Transformation Matrices
- Vector Spaces
- Frames
- Homogeneous Coordinates
- Transformation Matrices
