

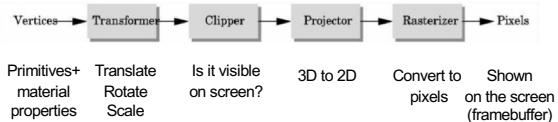

Graphics Pipeline

Graphics Pipeline
Primitives: Points, Lines, Triangles
[Angel Ch. 2]

Jernej Barbic
University of Southern California

1

Graphics Pipeline

2

The Framebuffer

- Special memory on the graphics card
- Stores the current pixels to be displayed on the monitor
- Monitor has no storage capabilities
- The framebuffer is copied to the monitor at each refresh cycle

3

Rendering with OpenGL

- Application generates the geometric primitives (polygons, lines)
- System draws each one into the framebuffer
- Entire scene redrawn anew every frame
- Compare to: off-line rendering (e.g., Pixar Renderman, ray tracers)

4

The pipeline is implemented by OpenGL, graphics driver and the graphics hardware

OpenGL programmer does not need to implement the pipeline.

However, pipeline is reconfigurable
→ "shaders"

5

Graphics Pipeline

- Efficiently implementable in hardware (but not in software)
- Each stage can employ multiple specialized processors, working in parallel, buses between stages
- #processors per stage, bus bandwidths are fully tuned for typical graphics use
- Latency vs throughput

6

Vertices (compatibility profile)

- Vertices in world coordinates
void glVertex3f(GLfloat x, GLfloat y, GLfloat z)
– Vertex (x, y, z) is sent down the pipeline.
– Function call then returns.
- Use `GLtype` for portability and consistency
- `glVertex{234}{sfid}[v]{TYPE coords}`

7

Vertices (core profile)

- Vertices in world coordinates
- Store vertices into a Vertex Buffer Object (VBO)
- Upload the VBO to the GPU during program during program initialization (before rendering)
- OpenGL renders directly from the VBO

8

Transformer (compatibility profile)

- Transformer in world coordinates
- Must be set before object is drawn!
`glRotatef(45.0, 0.0, 0.0, -1.0);`
`glVertex2f(1.0, 0.0);`
- Complex [Angel Ch. 3]

9

Transformer (core profile)

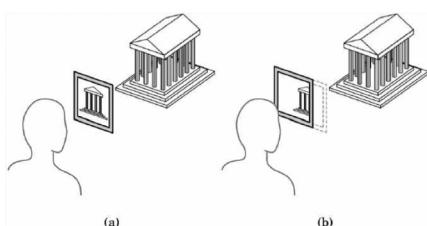

- Transformer in world coordinates
- 4x4 matrix
- Created manually by the user
- Transmitted to the shader program before rendering

10

Clipper

- Mostly automatic (must set viewing volume)

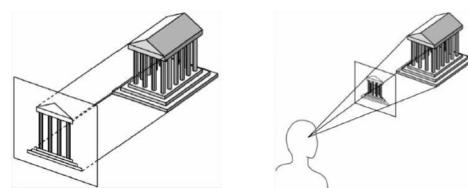

11

Projector

- Complex transformation [Angel Ch. 4]

Orthographic Perspective

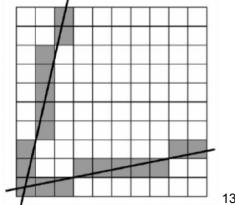

12

Rasterizer

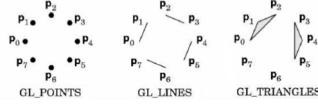

- Interesting algorithms [Angel Ch. 6]
- To window coordinates
- Antialiasing

13

Geometric Primitives

- Suppose we have 8 vertices: $p_0, p_1, p_2, p_3, p_4, p_5, p_6, p_7$
- Then, one can interpret them as:

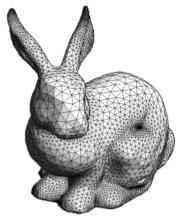

- GL_POINTS, GL_LINES, GL_TRIANGLES are examples of primitive type

14

Triangles

- Can be any shape or size
- Well-shaped triangles have advantages for numerical simulation
- Shape quality makes little difference for basic OpenGL rendering

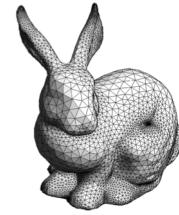

15

Geometric Primitives (compatibility profile)

- Specified via vertices
 - General schema
- ```

glBegin(type);
 glVertex3f(x1, y1, z1);
 ...
 glVertex3f(xN, yN, zN);
glEnd();

```
- type determines interpretation of vertices
  - Can use glVertex2f(x,y) in 2D

16

## Example: Draw Two Square Edges (compatibility profile)

- Type = GL\_LINES

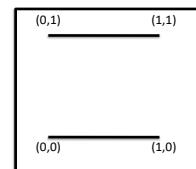

```

glBegin(GL_LINES);
 glVertex3f(0.0, 0.0, -1.0);
 glVertex3f(1.0, 0.0, -1.0);
 glVertex3f(1.0, 1.0, -1.0);
 glVertex3f(0.0, 1.0, -1.0);
glEnd();

```

- Calls to other functions are allowed between glBegin(type) and glEnd();

17

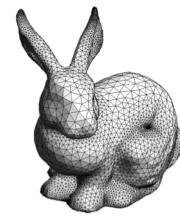

## Geometric Primitives (core profile)

- Specified via vertices
- Stored in a Vertex Buffer Object

```

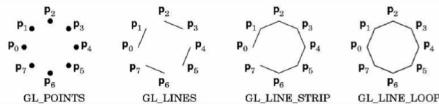

(VBO)
int numVertices = 300;
float vertices[3 * numVertices];
// (... fill the "vertices" array ...)
// create the VBO:
GLuint vbo;
 glGenBuffers(1, &vbo);
 glBindBuffer(GL_ARRAY_BUFFER, vbo);
 glBufferData(GL_ARRAY_BUFFER, sizeof(vertices),
 vertices, GL_STATIC_DRAW);

```

18

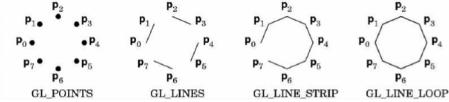

## Render Points and Line Segments (compatibility profile)

```
glBegin(GL_POINTS); // or GL_LINES to render lines
glVertex3f(...);
...
glVertex3f(...);
glEnd();
```

19

## Render Points and Line Segments (core profile)

```
glDrawArrays(GL_POINTS, 0, numVertices); // render points
glDrawArrays(GL_LINES, 0, numVertices); // render lines
```

20

## Main difference between the two profiles

### Compatibility:

```
Rendering:
glBegin(type);
glVertex3f(x1, y1, z1);
...
glVertex3f(xN, yN, zN);
glEnd();
```

### Core:

```
Initialization:
int numVertices = 300;
float vertices[3 * numVertices];
// (... fill the "vertices" array ...)

// create the VBO:
GLuint vbo;
 glGenBuffers(1, &vbo);
 glBindBuffer(GL_ARRAY_BUFFER, vbo);
 glBufferData(GL_ARRAY_BUFFER,
 sizeof(vertices), vertices, GL_STATIC_DRAW);

Rendering:
glDrawArrays(type, 0, numVertices);
```

21

## Common Bug

```
int numVertices = 50000;
float * vertices = (float*) malloc (sizeof(float) * 3 * numVertices);
...
glBufferData(GL_ARRAY_BUFFER,
 sizeof(vertices), vertices, GL_STATIC_DRAW);
```

What is wrong?

22

## Common Bug

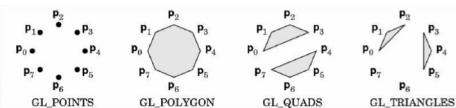

```
int numVertices = 50000;
float * vertices = (float*) malloc (sizeof(float) * 3 * numVertices);
...
glBufferData(GL_ARRAY_BUFFER,
 sizeof(vertices), vertices, GL_STATIC_DRAW);
```

23

## Polygons

- Polygons enclose an area

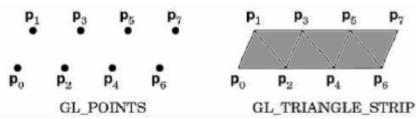

- Rendering of area (fill) depends on attributes
- All vertices must be in one plane in 3D
- GL\_POLYGON and GL\_QUADS are only available in the compatibility profile (removed in core profile since OpenGL 3.1)

24

## Triangle Strips

- Efficiency in space and time
- Reduces visual artefacts on old graphics cards

25

## Summary

1. Graphics pipeline
2. Primitives: vertices, lines, triangles

26
