## Mathematical Optimization

The task of selecting the “best” configuration of a set of variables from a “feasible” set of configurations.

$$\begin{array}{ll} \text{minimize (or maximize)} & f(x) \\ \text{subject to} & x \in \mathcal{X} \end{array}$$

- Terminology: decision variable(s), objective function, feasible set, optimal solution, optimal value
- Two main classes: **continuous** and **combinatorial**

## Continuous Optimization Problems

Optimization problems where feasible set  $\mathcal{X}$  is a connected subset of Euclidean space, and  $f$  is a continuous function.

- Instances typically formulated as follows.

$$\begin{array}{ll} \text{minimize} & f(x) \\ \text{subject to} & g_i(x) \leq b_i, \quad \text{for } i \in \mathcal{C}. \end{array}$$

- **Objective function**  $f : \mathbb{R}^n \rightarrow \mathbb{R}$ .
- **Constraint functions**  $g_i : \mathbb{R}^n \rightarrow \mathbb{R}$ . The inequality  $g_i(x) \leq b_i$  is the  $i$ 'th **constraint**.
- In general, intractable to solve efficiently (NP hard)

# Convex Optimization Problem

A continuous optimization problem where  $f$  is a convex function on  $\mathcal{X}$ , and  $\mathcal{X}$  is a convex set.

- **Convex function:**  $f(\alpha x + (1 - \alpha)y) \leq \alpha f(x) + (1 - \alpha)f(y)$  for all  $x, y \in \mathcal{X}$  and  $\alpha \in [0, 1]$
- **Convex set:**  $\alpha x + (1 - \alpha)y \in \mathcal{X}$ , for all  $x, y \in \mathcal{X}$  and  $\alpha \in [0, 1]$
- Convexity of  $\mathcal{X}$  implied by convexity of  $g_i$ 's
- For maximization problems,  $f$  should be **concave**
- Typically solvable efficiently (i.e. in polynomial time)
- Encodes optimization problems from a variety of application areas

# Convex Optimization Example: Least Squares Regression

Given a set of measurements  $(a_1, b_1), \dots, (a_m, b_m)$ , where  $a_i \in \mathbb{R}^n$  is the  $i$ 'th input and  $b_i \in \mathbb{R}$  is the  $i$ 'th output, find the linear function  $f : \mathbb{R}^n \rightarrow \mathbb{R}$  best explaining the relationship between inputs and outputs.

- $f(a) = x^T a$  for some  $x \in \mathbb{R}^n$
- Least squares: minimize mean-square error.

$$\text{minimize} \quad \|Ax - b\|_2^2$$

# Convex Optimization Example: Minimum Cost Flow

Given a directed network  $G = (V, E)$  with cost  $c_e \in \mathbb{R}_+$  per unit of traffic on edge  $e$ , and capacity  $d_e$ , find the minimum cost routing of  $r$  divisible units of traffic from  $s$  to  $t$ .

# Convex Optimization Example: Minimum Cost Flow

Given a directed network  $G = (V, E)$  with cost  $c_e \in \mathbb{R}_+$  per unit of traffic on edge  $e$ , and capacity  $d_e$ , find the minimum cost routing of  $r$  divisible units of traffic from  $s$  to  $t$ .

$$\begin{aligned} &\text{minimize} && \sum_{e \in E} c_e x_e \\ &\text{subject to} && \sum_{e \leftarrow v} x_e = \sum_{e \rightarrow v} x_e, && \text{for } v \in V \setminus \{s, t\}. \\ &&& \sum_{e \leftarrow s} x_e = r \\ &&& x_e \leq d_e, && \text{for } e \in E. \\ &&& x_e \geq 0, && \text{for } e \in E. \end{aligned}$$

# Convex Optimization Example: Minimum Cost Flow

Given a directed network  $G = (V, E)$  with cost  $c_e \in \mathbb{R}_+$  per unit of traffic on edge  $e$ , and capacity  $d_e$ , find the minimum cost routing of  $r$  divisible units of traffic from  $s$  to  $t$ .

$$\begin{aligned} & \text{minimize} && \sum_{e \in E} c_e x_e \\ & \text{subject to} && \sum_{e \leftarrow v} x_e = \sum_{e \rightarrow v} x_e, && \text{for } v \in V \setminus \{s, t\}. \\ & && \sum_{e \leftarrow s} x_e = r \\ & && x_e \leq d_e, && \text{for } e \in E. \\ & && x_e \geq 0, && \text{for } e \in E. \end{aligned}$$

Generalizes to traffic-dependent costs. For example

$$c_e(x_e) = a_e x_e^2 + b_e x_e + c_e.$$

## Combinatorial Optimization Problem

An optimization problem where the feasible set  $\mathcal{X}$  is finite.

- e.g.  $\mathcal{X}$  is the set of paths in a network, assignments of tasks to workers, etc...
- Again, NP-hard in general, but many are efficiently solvable (either exactly or approximately)

# Combinatorial Optimization Example: Shortest Path

Given a directed network  $G = (V, E)$  with cost  $c_e \in \mathbb{R}_+$  on edge  $e$ , find the minimum cost path from  $s$  to  $t$ .

# Combinatorial Optimization Example: Traveling Salesman Problem

Given a set of cities  $V$ , with  $d(u, v)$  denoting the distance between cities  $u$  and  $v$ , find the minimum length tour that visits all cities.

# Continuous vs Combinatorial Optimization

- Some optimization problems are best formulated as one or the other
- Many problems, particularly in computer science and operations research, can be formulated as both
- This dual perspective can lead to structural insights and better algorithms

## Example: Shortest Path

The shortest path problem can be encoded as a minimum cost flow problem, using distances as the edge costs, unit capacities, and desired flow rate 1

$$\begin{aligned} & \text{minimize} && \sum_{e \in E} c_e x_e \\ & \text{subject to} && \sum_{e \leftarrow v} x_e = \sum_{e \rightarrow v} x_e, && \text{for } v \in V \setminus \{s, t\}. \\ & && \sum_{e \leftarrow s} x_e = 1 \\ & && x_e \leq 1, && \text{for } e \in E. \\ & && x_e \geq 0, && \text{for } e \in E. \end{aligned}$$

The optimum solution of the (linear) convex program above will assign flow only on a single path — namely the shortest path.

# Course Goals

- Recognize and model convex optimization problems, and develop a general understanding of the relevant algorithms.
- Formulate combinatorial optimization problems as convex programs
- Use both the discrete and continuous perspectives to design algorithms and gain structural insights for optimization problems

# Who Should Take this Class

- Anyone planning to do research in the design and analysis of algorithms
  - Convex and combinatorial optimization have become an indispensable part of every algorithmist's toolkit
- Students interested in theoretical machine learning and AI
  - Convex optimization underlies much of machine learning
  - Submodularity has recently emerged as an important abstraction for feature selection, active learning, planning, and other applications
- Anyone else who solves or reasons about optimization problems: electrical engineers, control theorists, operations researchers, economists . . .
  - If there are applications in your field you would like to hear more about, let me know.

# Who Should Not Take this Class

- You don't satisfy the prerequisites "in practice"
- You are looking for a "cookbook" of optimization algorithms, and/or want to learn how to use CPLEX, CVX, etc
  - This is a THEORY class
  - We will bias our attention towards simple yet theoretically insightful algorithms and questions
  - We will not write code

# Course Outline

- Weeks 1-5: Convex optimization basics and duality theory
- Weeks 6-7: Combinatorial problems posed as linear and convex programs
- Weeks 8-9: Algorithms for convex optimization
- Weeks 10-11: Matroid theory and optimization
- Weeks 12-13: Submodular Function optimization
- Week 14: Semidefinite programming and constraint satisfaction problems
- Week 15: Additional topics

# Outline

1 Course Overview

2 Administrivia

# Basic Information

- Lecture time: Mondays 3:00pm - 6:20pm
- Lecture place: GFS 222
- Instructor: Shaddin Dughmi
  - Email: shaddin@usc.edu
  - Office: SAL 234
  - Office Hours: TBD
- TA: Haifeng Xu
  - Email: haifengx@usc.edu
  - Office Hours: TBA
- Course Homepage:  
<http://www-bcf.usc.edu/shaddin/cs675fa16/index.html>
- References: Convex Optimization by Boyd and Vandenberghe, and Combinatorial Optimization by Korte and Vygen. (Available online through USC libraries. Will place on reserve)
- Additional References: Schrijver, Luenberger and Ye (available online through USC libraries)

- Mathematical maturity: Be good at proofs, at the graduate level.
- Linear algebra at advanced undergrad / beginning grad level
- Exposure to algorithms or optimization at advanced undergrad / beginning grad level
  - CS570 or equivalent, or
  - CS270 and you did really well

# Requirements and Grading

- This is an advanced elective class, so grade is not the point.
  - I assume you want to learn this stuff.
- 4-6 homeworks, 75% of grade.
  - Proof based.
  - Challenging.
  - Discussion allowed, even encouraged, but must write up solutions independently.
- Research project worth 25% of grade. Project suggestions will be posted on website.
- 5 late days allowed total (use in integer amounts)
