

CS675: Convex and Combinatorial Optimization  
Fall 2019  
Convex Sets

Instructor: Shaddin Dughmi

# Outline

- 1 Convex sets, Affine sets, and Cones
- 2 Examples of Convex Sets
- 3 Convexity-Preserving Operations
- 4 Separation Theorems

## Convex Sets

A set  $S \subseteq \mathbb{R}^n$  is **convex** if the line segment between any two points in  $S$  lies in  $S$ . i.e. if  $x, y \in S$  and  $\theta \in [0, 1]$ , then  $\theta x + (1 - \theta)y \in S$ .

## Convex Sets

A set  $S \subseteq \mathbb{R}^n$  is **convex** if the line segment between any two points in  $S$  lies in  $S$ . i.e. if  $x, y \in S$  and  $\theta \in [0, 1]$ , then  $\theta x + (1 - \theta)y \in S$ .

## Equivalent Definition

$S$  is convex if every **convex combination** of points in  $S$  lies in  $S$ .

## Convex Combination

- **Finite:**  $y$  is a convex combination of  $x_1, \dots, x_k$  if  $y = \theta_1 x_1 + \dots + \theta_k x_k$ , where  $\theta_i \geq 0$  and  $\sum_i \theta_i = 1$ .
- **General:** expectation of probability measure on  $S$ .

## Convex Hull

The convex hull of  $S \subseteq \mathbb{R}^n$  is the smallest convex set containing  $S$ .

- Intersection of all convex sets containing  $S$
- The set of all convex combinations of points in  $S$

# Convex Sets

## Convex Hull

The convex hull of  $S \subseteq \mathbb{R}^n$  is the smallest convex set containing  $S$ .

- Intersection of all convex sets containing  $S$
- The set of all convex combinations of points in  $S$

A set  $S$  is convex if and only if  $\text{convexhull}(S) = S$ .

## Affine Set

A set  $S \subseteq \mathbb{R}^n$  is **affine** if the line passing through any two points in  $S$  lies in  $S$ . i.e. if  $x, y \in S$  and  $\theta \in \mathbb{R}$ , then  $\theta x + (1 - \theta)y \in S$ .

Obviously, affine sets are convex.

## Affine Set

A set  $S \subseteq \mathbb{R}^n$  is **affine** if the line passing through any two points in  $S$  lies in  $S$ . i.e. if  $x, y \in S$  and  $\theta \in \mathbb{R}$ , then  $\theta x + (1 - \theta)y \in S$ .

Obviously, affine sets are convex.

## Equivalent Definition

$S$  is affine if every **affine combination** of points in  $S$  lies in  $S$ .

## Affine Combination

$y$  is an affine combination of  $x_1, \dots, x_k$  if  $y = \theta_1 x_1 + \dots + \theta_k x_k$ , and  $\sum_i \theta_i = 1$ .

Generalizes convex combinations

## Equivalent Definition II

$S$  is affine if and only if it is a shifted subspace

- i.e.  $S = x_0 + V$ , where  $V$  is a linear subspace of  $\mathbb{R}^n$ .
- Any  $x_0 \in S$  will do, and yields the same  $V$ .
- The **dimension** of  $S$  is the dimension of subspace  $V$ .

## Equivalent Definition II

$S$  is affine if and only if it is a shifted subspace

- i.e.  $S = x_0 + V$ , where  $V$  is a linear subspace of  $\mathbb{R}^n$ .
- Any  $x_0 \in S$  will do, and yields the same  $V$ .
- The **dimension** of  $S$  is the dimension of subspace  $V$ .

## Equivalent Definition III

$S$  is affine if and only if it is the solution of a set of linear equations (i.e. the intersection of hyperplanes).

- i.e.  $S = \{x : Ax = b\}$  for some matrix  $A \in \mathbb{R}^{m \times n}$  and  $b \in \mathbb{R}^m$ .

## Affine Hull

The affine hull of  $S \subseteq \mathbb{R}^n$  is the smallest affine set containing  $S$ .

- Intersection of all affine sets containing  $S$
- The set of all affine combinations of points in  $S$

## Affine Hull

The affine hull of  $S \subseteq \mathbb{R}^n$  is the smallest affine set containing  $S$ .

- Intersection of all affine sets containing  $S$
- The set of all affine combinations of points in  $S$

A set  $S$  is affine if and only if  $\text{affinehull}(S) = S$ .

# Affine Sets

## Affine Hull

The affine hull of  $S \subseteq \mathbb{R}^n$  is the smallest affine set containing  $S$ .

- Intersection of all affine sets containing  $S$
- The set of all affine combinations of points in  $S$

A set  $S$  is affine if and only if  $\text{affinehull}(S) = S$ .

## Affine Dimension

The **affine dimension** of a set is the dimension of its affine hull

## Cones

A set  $K \subseteq \mathbb{R}^n$  is a **cone** if the ray from the origin through every point in  $K$  is in  $K$  i.e. if  $x \in K$  and  $\theta \geq 0$ , then  $\theta x \in K$ .

Note: every cone contains 0.

## Cones

A set  $K \subseteq \mathbb{R}^n$  is a **cone** if the ray from the origin through every point in  $K$  is in  $K$  i.e. if  $x \in K$  and  $\theta \geq 0$ , then  $\theta x \in K$ .

Note: every cone contains  $0$ .

## Special Cones

- A **convex cone** is a cone that is convex
- A cone is **pointed** if whenever  $x \in K$  and  $x \neq 0$ , then  $-x \notin K$ .
- We will mostly mention **proper** cones: convex, pointed, closed, and of full affine dimension.

## Equivalent Definition

$K$  is a convex cone if every **conic combination** of points in  $K$  lies in  $K$ .

## Conic Combination

$y$  is a conic combination of  $x_1, \dots, x_k$  if  $y = \theta_1 x_1 + \dots + \theta_k x_k$ , where  $\theta_i \geq 0$ .

## Conic Hull

The conic hull of  $K \subseteq \mathbb{R}^n$  is the smallest convex cone containing  $K$

- Intersection of all convex cones containing  $K$
- The set of all conic combinations of points in  $K$

## Conic Hull

The conic hull of  $K \subseteq \mathbb{R}^n$  is the smallest convex cone containing  $K$

- Intersection of all convex cones containing  $K$
- The set of all conic combinations of points in  $K$

A set  $K$  is a convex cone if and only if  $\text{conichull}(K) = K$ .

## Polyhedral Cone

A cone is **polyhedral** if it is the set of solutions to a finite set of homogeneous linear inequalities  $Ax \leq 0$ .

# Outline

- 1 Convex sets, Affine sets, and Cones
- 2 Examples of Convex Sets**
- 3 Convexity-Preserving Operations
- 4 Separation Theorems

- Linear Subspace: Affine, Cone
- Hyperplane: Affine, cone if includes 0
- Halfspace: Cone if origin on boundary
- Line: Affine, cone if includes 0
- Ray: Cone if endpoint at 0
- Line segment

- Polyhedron: finite intersection of halfspaces

- Polytope: Bounded polyhedron

- Nonnegative Orthant  $\mathbb{R}_+^n$ : Polyhedral cone
- Simplex: convex hull of affinely independent points
  - Unit simplex:  $x \succeq 0, \sum_i x_i \leq 1$
  - Probability simplex:  $x \succeq 0, \sum_i x_i = 1$ .

- Euclidean ball:  $\{x : \|x - x_c\|_2 \leq r\}$  for center  $x_c$  and radius  $r$
- Ellipsoid:  $\{x : (x - x_c)^T P^{-1}(x - x_c) \leq 1\}$  for symmetric  $P \succeq 0$ 
  - Equivalently:  $\{x_c + Au : \|u\|_2 \leq 1\}$  for some linear map  $A$

- Norm ball:  $\{x : \|x - c\| \leq r\}$  for any norm  $\|\cdot\|$

The unit sphere for different metrics:  $\|x\|_{l_p} = 1$  in  $\mathbb{R}^2$ .

- Norm ball:  $\{x : \|x - c\| \leq r\}$  for any norm  $\|\cdot\|$

The unit sphere for different metrics:  $\|x\|_{l_p} = 1$  in  $\mathbb{R}^2$ .

- Norm cone:  $\{(x, r) : \|x\| \leq r\}$
- Cone of symmetric positive semi-definite matrices  $M$ 
  - Symmetric matrix  $A \succeq 0$  iff  $x^T A x \geq 0$  for all  $x$

# Outline

- 1 Convex sets, Affine sets, and Cones
- 2 Examples of Convex Sets
- 3 Convexity-Preserving Operations**
- 4 Separation Theorems

## Intersection

The intersection of two convex sets is convex. This holds for the intersection of an infinite number of sets.

## Examples

- Polyhedron: intersection of halfspaces
- PSD cone: intersection of linear inequalities  $z^T A z \geq 0$ , for all  $z \in \mathbb{R}^n$ .

## Intersection

The intersection of two convex sets is convex. This holds for the intersection of an infinite number of sets.

## Examples

- Polyhedron: intersection of halfspaces
- PSD cone: intersection of linear inequalities  $z^T A z \geq 0$ , for all  $z \in \mathbb{R}^n$ .

In fact, we will see that every closed convex set is the intersection of a (possibly infinite) set of halfspaces.

## Affine Maps

If  $f : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is an affine function (i.e.  $f(x) = Ax + b$ ), then

- $f(S)$  is convex whenever  $S \subseteq \mathbb{R}^n$  is convex
- $f^{-1}(T)$  is convex whenever  $T \subseteq \mathbb{R}^m$  is convex

$$\begin{aligned}f(\theta x + (1 - \theta)y) &= A(\theta x + (1 - \theta)y) + b \\&= \theta(Ax + b) + (1 - \theta)(Ay + b) \\&= \theta f(x) + (1 - \theta)f(y)\end{aligned}$$

## Examples

- An ellipsoid is image of a unit ball after an affine map
- A polyhedron  $Ax \preceq b$  is inverse image of nonnegative orthant under  $f(x) = b - Ax$

## Perspective Function

Let  $P : \mathbb{R}^{n+1} \rightarrow \mathbb{R}^n$  be  $P(x, t) = x/t$ .

- $P(S)$  is convex whenever  $S \subseteq \mathbb{R}^{n+1}$  is convex
- $P^{-1}(T)$  is convex whenever  $T \subseteq \mathbb{R}^n$  is convex

## Perspective Function

Let  $P : \mathbb{R}^{n+1} \rightarrow \mathbb{R}^n$  be  $P(x, t) = x/t$ .

- $P(S)$  is convex whenever  $S \subseteq \mathbb{R}^{n+1}$  is convex
- $P^{-1}(T)$  is convex whenever  $T \subseteq \mathbb{R}^n$  is convex

Generalizes to **linear fractional functions**  $f(x) = \frac{Ax+b}{c^T x+d}$

- Composition of perspective with affine.

# Outline

- 1 Convex sets, Affine sets, and Cones
- 2 Examples of Convex Sets
- 3 Convexity-Preserving Operations
- 4 Separation Theorems**

## Separating Hyperplane Theorem

If  $A, B \subseteq \mathbb{R}^n$  are disjoint convex sets, then there is a hyperplane **weakly** separating them. That is, there is  $a \in \mathbb{R}^n$  and  $b \in \mathbb{R}$  such that  $a^\top x \leq b$  for every  $x \in A$  and  $a^\top y \geq b$  for every  $y \in B$ .

## Separating Hyperplane Theorem (Strict Version)

If  $A, B \subseteq \mathbb{R}^n$  are disjoint **closed** convex sets, and at least one of them is compact, then there is a hyperplane **strictly** separating them. That is, there is  $a \in \mathbb{R}^n$  and  $b \in \mathbb{R}$  such that  $a^\top x < b$  for every  $x \in A$  and  $a^\top y > b$  for every  $y \in B$ .

## Farkas' Lemma

Let  $K$  be a **closed convex cone** and let  $w \notin K$ . There is  $z \in \mathbb{R}^n$  such that  $z^\top x \geq 0$  for all  $x \in K$ , and  $z^\top w < 0$ .

# Supporting Hyperplane

## Supporting Hyperplane Theorem.

If  $S \subseteq \mathbb{R}^n$  is a closed convex set and  $y$  is on the boundary of  $S$ , then there is a hyperplane **supporting**  $S$  at  $y$ . That is, there is  $a \in \mathbb{R}^n$  and  $b \in \mathbb{R}$  such that  $a^\top x \leq b$  for every  $x \in S$  and  $a^\top y = b$ .
