

## Final Project Summary

The purpose of my Final Project was to use an API and DOM manipulation to build a “wishlist” of sorts for players of the Pokemon Trading Card Game. Things went a little awry after using the Pokemon card API became challenging and borderline confusing, and I got COVID. Yay! However, I’m still happy with the final product.

Here’s how it works. You go to the Pokemon Search tab and type in the name of any pokemon. Give the program a second to load, then right-click and copy the image address of a Pokemon card that catches your eye. Then, go to the wishlist and fill out the corresponding information written on the Pokemon card, and save it. Have fun!

The Pokemon TCG API documentation can be found here (<https://docs.pokemontcg.io/>). Alongside the API, I used DOM manipulation to save the user entries in a table.
